1. ATR filenames (was: It has begun...)

Newsgroup: comp.sys.atari.8bit

On Sun, 30 Dec 2001 at 13:07:34 GMT, "Frank Rachel" (frank-rachel
at home dot com) scribbled:
->I can easily rename, but just curious, what DOS's wouldn't recognize
->the "_". The ATR's are used by emulators, which typically exist for
->modern OS's..

In the heyday of the 8-bits, back when people were using real hardware (not emulation), I don't think any red-blooded Atarian would've used any punctuation symbols in filenames -- even if some offbeat or relatively unusual Atari 8-bit Dos program would've supported it. That's because ADOS 2.0 (i.e., Atari Company's Dos) and its main compatibles (including ADOS 2.5) didn't support punctuation marks in filenames. Using punctuation in filenames would've made such files incompatible with the overwhelming majority of other Atari 8-bitters as well as almost all of their software and programming and all the situations in which Atari programs and files were used, including BBSes.

Doing so now sounds like a recipe for disaster. But by all means, go ahead and do it! The way most people learn is by experience, and you'll enjoy the experience and all the extra time and effort at some point in the future when some Atari program you're running by emulation refuses to recognize illegal filenames and you're forced to fix dozens or hundreds of filenames by some roundabout method! That'll be fun, for sure! <grin>

ok a game for a atari 8 bit - can't remember very much about it, but it was a kind of fly around thing, with a simple green/blue sky/ground thing, and wireframe graphics for buildings. can't remember what the object of the game was either!

any help would be appreciated!

Which is all well and good except for the minor fact that nobody was talking
about renaming Atari DOS files, but rather the filenames of the ATR images
that contain Atari files.

I could be a bit behind the times, but I don't know of any Atari 8-bit
program that uses ATR images. DCM files, on the other hand, would cause
some problems.

4. Re: Best demo on the 8-bit

Where did you get timekeeper from please?

I looked on both the mentioned sites and can't see it

1.9) What is the Atari 800XE?
1.10) What is the Atari XE Game System?
1.11) What are the 6502, ANTIC, CTIA/GTIA, POKEY, and FREDDIE chips?
1.12) What is the internal layout of the 8-bit Atari?
1.13) What issues surround NTSC vs PAL versions of the 8-bit Atari?
1.14) What are the pinouts for the various ports on the Atari?

Video Display
2.1) What video display devices can I use with my Atari?

Mass Storage
3.1) What are the Atari 410, 1010, and XC12 Program Recorders?
3.2) How do I run a program from cassette?
3.3) What are the Atari 810, 1050, and XF551 Disk Drives?
3.4) What other floppy disk drives can I use with my Atari?
3.5) What kinds of 5.25" floppy disks can I use with my Atari drives?
3.6) How can I use a hard drive with my 8-bit Atari?

Printers
4.1) What are the Atari 820, 822, and 825 Printers?
4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?
4.3) What are the Atari XMM801 and XDM121 Printers?
4.4) What other printers can I use with my Atari?

Modems
5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?
5.2) What should I know about modems and the Atari?

More hardware
6.1) What is the Atari 850 Interface Module?
6.2) What is the Atari XEP80 Interface Module?
6.3) What accessories did Atari produce for their 8-bit computers?
6.4) What "vaporware" computers/peripherals were never released?
6.5) What are the power requirements for my Atari components?

Core software: OS, BASIC, DOS
7.1) What versions of the Atari Operating System (OS) are there?
7.2) What is the ATASCII character set?
7.3) What versions of Atari BASIC are there?
7.4) What are Atari DOS I, DOS II v2.0S, DOS III, DOS 2.5, and DOS XE?
7.5) What's the best DOS for the Atari?
7.6) How do I modify Atari DOS to support more than two drives?
7.7) Are there Graphical User Interfaces (GUIs) for the Atari?

Software
8.1) What are the best terminal emulators available?
8.2) What BBS software can be used on the Atari?
8.3) What programming languages are available for the Atari?
8.4) What cartridges were released for the Right Slot of the 800?
8.5) What games support 4 or more simultaneous players?
8.6) What programs run only on the 400 and 800 models, and why?
8.7) What programs make use of the Light Gun or a light pen?
8.8) What programs have a track ball mode or support a mouse?
8.9) What programs have a paddle(s) or Koala Pad mode?
8.10) What programs have a CX85 mode?
8.11) What programs have a Touch tablet mode?

File Formats
9.1) What's this UUEncoding stuff (.uu, .uue files) all about?
9.2) What is an .arc file?
9.3) What are the .DCM, .ATR, .XFD, .SCP, and .DI disk image formats?
9.4) What are the .XMO and .BIN file formats?
9.5) How can I make my commercial boot disk (tape, cart) into a load file
or disk image?
9.6) How can I convert my commercial boot tape into a cassette image file?

File Transfer Solutions
10.1) Can I read/write 8-bit Atari disks on an IBM-PC?
10.2) How do I transfer files using a null modem cable?
10.3) What is SIO2PC?
10.4) What is the Atari Peripheral Emulator (APE)?

Timeline
11.1) How did Atari get its name?
11.2) What is the History of Atari?

Subject: 1.1) What is an Atari 8-bit computer?

Based in Silicon Valley in the U.S.A., the company known as Atari produced a line of home computers from 1979 to 1992 often referred to collectively as the "Atari 8-bits," the "8-bit Ataris," the "400/800/XL/XE series," etc.

The computers included the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

These machines competed in the marketplace with the likes of the Commodore 64 series, the Apple II series, the Texas Instruments TI99/4A, and the Radio Shack Color Computer. Of these, the 8-bit Atari is most similar to the Commodore 64.

The 8-bit Atari computers do not use the same cartridges or floppy disks as any other Atari platforms, such as the 2600 Video Computer System (VCS), the 5200 SuperSystem, the 7800 ProSystem, or the ST/TT/Falcon computers. All of these but the 5200, however, do share the same joystick/controller hardware port.

The 5200 SuperSystem is actually nearly identical to the 8-bit computers internally, yet cartridges for the 5200 and the 8-bit computers cannot be exchanged, primarly due to the physically different cartridge ports.

Here are some of the performance specifications of the 8-bit Atari computers:

(Some of the rest of this section by Bill Kendrick)

CPU: 6502 (MOS Technology)
CPU CLOCK SPEED:
NTSC machines: 1.7897725 MHz
PAL machines: 1.773447 MHz

SCREEN REFRESH RATE:
59.94 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

GRAPHICS MODES:
ANTIC CIO/BASIC Display Resolution Number of

* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.
```

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16 luminances x 16 hues = 256 colors. (Four registers are for player-missile graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video incarnation, are totally redefinable.

PLAYER-MISSILE GRAPHICS: (byte height and OR corrections from Piotr Fusik)
Four 8-bit wide, 120 or 240 byte high single color players, and four 2-bit wide, 120 or 240 byte high single color missiles are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to OR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display List - a program which is executed by the ANTIC graphics chip every screen refresh:

All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the

keyclick can be disabled.

Subject: 1.2) What is the Atari 400?

Released along with the 800 in 1979, the 400 was the low-end model of the two. The only 8-bit Atari with a membrane keyboard rather than a full-stroke keyboard. One of the few 8-bit Ataris lacking a composite monitor port. Originally released with just 8K RAM, but most were sold with 16K RAM. There was also a factory-authorized 48K upgrade available through dealers.

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 400 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 1982 Atari catalog calls the 400 "The Basic Computer".

The 400 was discontinued in 1983.

During development the 400 was known internally as "Candy."

Subject: 1.3) What is the Atari 800?

Released along with the 400 in 1979, the 800 was the high-end model of the two. The 800 is the only 8-bit Atari with a Right Cartridge slot, in addition to the Left Cartridge slot as present on all 8-bit Ataris. Originally released with just 8K RAM, many were sold with 16K, later on 48K was standard.

The 800 is also the only 8-bit Atari with a four-slot modular design, where the first slot holds the CX801 (CX801-P for PAL machines) 10K ROM module, and the other three slots hold combinations of CX852 8K or CX853 16K RAM modules.

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 800 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 800 was discontinued in 1983.

During development the 800 was known internally as "Colleen."

Subject: 1.4) What is the Atari 1200XL?

Released as a big brother to the 400/800 in 1982, the 1200XL now uses Atari's slightly customized 6502C microprocessor, and includes a full 64K RAM. The 1200XL was the first 8-bit Atari with just 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, 4 LEDs, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's

speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

The 1200XL was the biggest single step forward in development of the 8-bit Atari platform, but the corresponding software compatability problems hurt its popularity.

The 1200XL lacks separate chroma video signal, and also lacks the +5 Volts power on pin 10 of the SIO port.

The 1200XL was discontinued in 1983.

Subject: 1.5) What is the Atari 600XL?

Released in 1983 as a replacement for the 400, the 600XL is the low-end version of the 800XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the Atari 1064 Memory Module.

Normally boots with Atari BASIC (Revision B) enabled;
Hold down [Option] on startup to boot without BASIC.

The North American/NTSC 600XL does not include a composite monitor port;
The European/PAL 600XL includes the monitor port, but this lacks the chroma video signal.

The 600XL was discontinued in 1985.

Subject: 1.6) What is the Atari 800XL?

Released in 1983 as a replacement for the 800 and 1200XL, the 800XL is the high-end version of the 600XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM.

Normally boots with Atari BASIC (Revision B) enabled;
Hold down [Option] on startup to boot without BASIC.

The 800XL lacks separate chroma video signal.

There was a late version of the 800XL in Europe, called 800XLF. The 800XLF includes a redesigned motherboard (a la the XE computers) and contains FREDDIE for memory management and has chroma output. BASIC is Revision C.

Though Atari never disclosed sales figures, the 800XL was likely the most-sold of all 8-bit Atari computer models.

The 800XL was discontinued in 1985.

Subject: 1.7) What is the Atari 65XE?

Released in 1985 as a replacement for the 600XL, the 65XE is the low-end version of the 130XE. The 65XE is nearly identical to the 800XL in features, minus the PBI. European 65XE's include the ECI port, present only on the 130XE in North America. All XE computers also include the FREDDIE memory management chip.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

The 65XE was discontinued in 1992.

Subject: 1.8) What is the Atari 130XE?

Released in 1985 as a replacement for the 800XL, the 130XE is the high-end version of the 65XE. The 130XE offers 128K RAM, plus the FREDDIE memory management chip, supporting the unique (but rarely used) ability for the 6502 and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of a fast parallel port.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

The 130XE was discontinued in 1992.

Subject: 1.9) What is the Atari 800XE?

Unseen and unknown in North America, the 800XE was sold in eastern Europe. The 800XE is identical in features to the European version of the 65XE (which was sold in western Europe). The 800XE could also be described as a 64K version of the 130XE.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

Jindrich Kubec writes, "The problematic Chinese 800XEs with GTIA problems were manufactured in 1992."

The 800XE was discontinued in 1992.

Subject: 1.10) What is the Atari XE Game System?

In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in

Missile Command game (hold down Select at startup), while offering 64K RAM
and full compatibility with the 65XE. It was packaged with the Light Gun,
and the Flight Simulator II and Bug Hunt cartridges.

James Bradford offers:
With the keyboard connected and no cart, basic boots, with out a
keyboard connected and no cart, the built in game runs.
There is only 1 32K ROM in the XEGS, it has the OS, BASIC (Rev C) and
Missile Command on it.

The XE Game System was discontinued in 1992.

Subject: 1.11) What are the 6502, ANTIC, CTIA/GTIA, POKEY, and FREDDIE chips?

Some of the following text was written by Chris Crawford and appears in De
Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc.,
1981-1982. See: http://www.atariarchives.org/APX/showinfo.php?cat=90008

The internal layout of the Atari 8-bit computer is very different from other
systems. It of course has a microprocessor (a 6502), RAM, ROM, and a PIA.
However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA,
and POKEY. These chips were designed by Atari engineers primarily to take
much of the burden of housekeeping off of the 6502, thereby freeing the 6502
to concentrate on computations. While they were at it, they designed a great
deal of power into these chips. Each of these chips is almost as big (in terms
of silicon area) as a 6502, so the three of them together provide a tremendous
amount of power. Mastering the Atari 8-bit computers is primarily a matter of
mastering these three chips.

6502 Central Processing Unit (CPU)
====
While the 400/800 models contain a generic 6502B CPU (a faster version of the
original 6502A microprocessor), all of the XL/XE models contain Atari's
customized 6502C chip.

On the Atari, there are two microprocessors, ANTIC and the 6502. To allow
them to coexist, ANTIC must shut off the 6502, a process called DMA. The
6502B supports DMA, but in Atari's implementation, it required 4 chips. The
6502C has an extra line called HALT. It is controlled by ANTIC which uses it
whenever it needs the data/address bus. The HALT line is on pin 35 of the
Atari 6502C and must be pulled high for the chip to work.

ANTIC
=====
ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor
dedicated to the television display. It is a true microprocessor; it has an
instruction set, a program (called the display list), and data. The display
list and the display data are written into RAM by the 6502. ANTIC retrieves
this information from RAM using direct memory access (DMA). It processes the
higher level instructions in the display list and translates these
instructions into a real-time stream of simple instructions to GTIA.

CTIA/GTIA
=========
CTIA ("Color Television Interface Adapter") / GTIA ("George's Television Interface Adapter") is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missile graphics, and collision detection.

Early 400/800 models included CTIA, later 400/800 models and all later 8-bit Ataris included GTIA.

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Clay Halliwell provides this tidbit:
A bit of trivia: CTIA 400/800s artifact in blue/green, GTIA 400/800s artifact in green/blue, and all XL/XEs artifact in red/blue.

Jerry Jessop explains why French Ataris produce fewer colors:
I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible.

POKEY
=====
POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

FREDDIE
=======
The 65XE/130XE/800XE/XEGS contain a small additional LSI called FREDDIE, a RAM address multiplexer. According to James Bradford, "FREDDIE is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory.

FREDDIE also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDIE but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDIE, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDIE for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDIE does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDIE) and an extra 8 RAM chips."

And more recently James Bradford has written:
FREDDIE is just a memory decoder and timer. It replaces several chips in the 800XL. The small chip near FREDDIE does all the bank selection. CO25953. One line from FREDDIE, Ras (or is it cas?) goes to this chip, Halt and the bank /processor select lines go into this same chip and ras (cas?) comes out. A pin for each bank. If I remember correctly, refresh also goes into this small chip. It would be quite easy to make an 800XL work just like a 130XE with this chip since Ras (Cas?) is required by ALL dynamic RAM.

======
Technical data and schematics for the ANTIC, GTIA, and POKEY chips are available on Curt Vendel's web site, thanks to permission from Hasbro's Atari Interactive Division's release of this data. See:

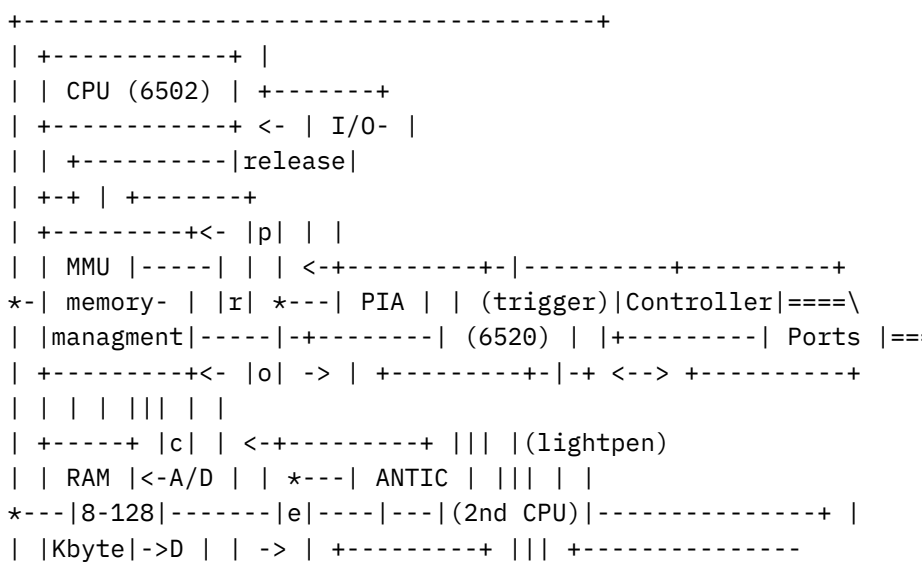
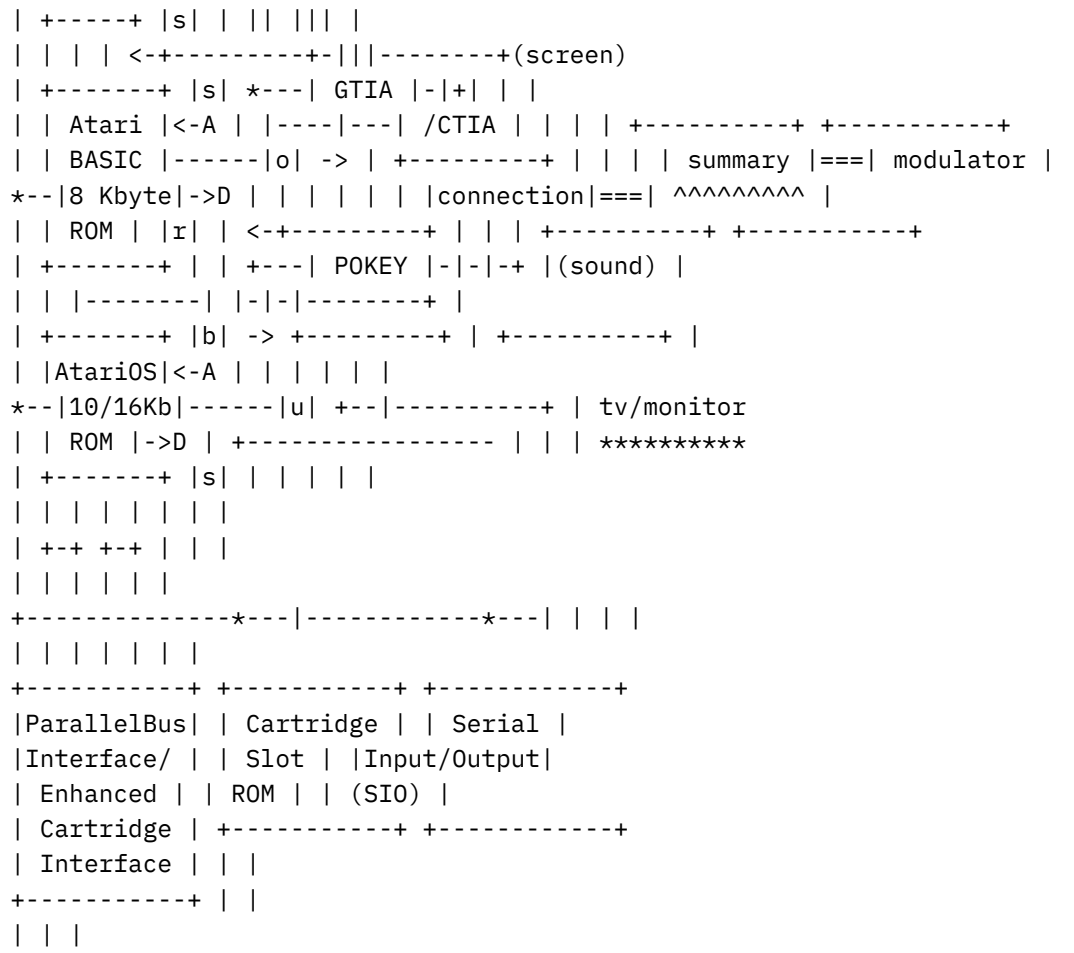
Subject: 1.12) What is the internal layout of the 8-bit Atari?

ASCII art by Thomas Havemeister.





- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800: 8K, 16K or 48K standard
600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard
130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502B, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE/European 65XE only
* Some late XE's use a 68B21 for PIA; PIA is 6520/6520A on all others

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:

Subject: 1.13) What issues surround NTSC vs PAL versions of the 8-bit Atari?

Contributors to this section:
Wayne Booth, Graham Thornton, Brent Buescher Jr., Thomas Richter

Some quick definitions first:

NTSC standard: Abbreviation for "National Television Standards Committee"
TV signal standard used in North America, Central America, a number of South American countries, and some Asian countries, including Japan.
525 lines per frame
60 half-frames per second (interlaced) = 60 Hz
Complete frame refreshed 30 times per second

PAL: Acronym for "phase alternation by line"
TV signal standard used in the United Kingdom, much of the rest of western Europe, several South American countries, some Middle East and Asian countries, several African countries, Australia, New Zealand, and other Pacific island countries.
625 lines per frame
50 half-frames per second (interlaced) = 50 Hz
Complete frame refreshed 25 times per second.

PAL-M: A modified version of PAL, used in Brazil.

SECAM: Acronym for "systeme electronique couleur avec memoire"
TV signal standard used in France, eastern European countries, the former USSR, and some African countries.
625 lines per frame
50 half-frames per second (interlaced) = 50 Hz
Complete frame refreshed 25 times per second.

Now then, how do the differences among 8-bit Atari computers designed for the different world television signal standards affect users trying to use software written elsewhere in the world?

The 50Hz vertical refresh frequency of PAL machines translates into more vertical blank interrupt (VBI) time for demos and other computation-intensive graphics software, when compared to the time available for VBIs on NTSC machines with the faster 60Hz refresh frequency. So PAL demos and games that

won't work on NTSC machines are usually returning from a VBI too late. Some also attempt to use more vertical resolution ("longer" display lists) than an NTSC display can handle.

Note that the reverse is also true. Software using VBIs will run more slowly on a PAL Atari than on an NTSC Atari.

Replacing the NTSC ANTIC chip in an NTSC Atari with a PAL ANTIC changes the screen refresh rate to 50Hz, allowing most of the PAL-only European software to run on a North American NTSC Atari. However, make sure your display device can support a 50Hz PAL signal first! North American Atari users can also obtain and use real European PAL Atari machines, with the same caveat concerning the display device.

Bottom line:
Software written for NTSC machines (North America) will always work on PAL machines (Europe), but software designed on PAL machines won't necessarily work on NTSC machines.

Thomas Richter mentions another NTSC vs PAL issue:
Another point is that the popular pseudo-colors used in the ANTIC-F (Graphics 8) mode are not colorful at all when displayed on a PAL TV, because of differences in the color encoding for the TV. The schematics of the XL computers include however a hack how to change the PAL version to the NTSC version (the PAL versions include two crystals, one with 5/4th of the frequency of the other. One is used for the system clock, the other for the color clock), but I never dared to apply it.

Subject: 1.14) What are the pinouts for the various ports on the Atari?

Controller Port (4 on 400/800, 2 on all others):

Subject: 2.1) What video display devices can I use with my Atari?

Most 8-bit Atari computers put out video signals in two places:

1) Radio-Frequency (RF) signal: VHF Channel 2 or 3, selectable via a switch on the computer.

Accessories needed:
a) RF Cable. (RF=radio frequency--video and audio signals in the same line)
On the 400/800 models, the RF Cable does not detach from the computer.
The output end of the cable is an RCA male connector.

b) TV Switch Box. Includes an RCA female connector for RF signal input from the Atari, input connector(s) for your TV attenna and/or cable TV company, and 75- and/or 300-ohm VHF output connector(s) for connection to the VHF input on the television. (Radio Shack carries a suitable TV Switch Box.)

2) A proprietary 5-pin DIN Monitor Jack, which includes two video signals:
a) Composite video.
b) Y/C Video, also known as S-Video:
separate composite luminance (Y) and chrominance (C) signals.

Exceptions among the computer models:
-the 400 and North American 600XL lack the Monitor Jack.
-the XE Game System includes an RCA-style jack in place of the Monitor Jack, providing a plain composite video signal only.
-the Monitor Jack on the 600XL, 800XL and 1200XL lacks the separate chrominance signal. (But it exists internally, and can be restored to the monitor jack via hardware modification.)

The pinout for the Atari Monitor Jack is in the pinouts sections of this FAQ list.

The typical Atari Monitor Cable includes the male 5-pin DIN connector on one end, and two RCA male connectors on the other end. One of the RCA connectors will carry the monophonic sound signal, and the other will carry the composite video signal. Color composite monitors were common in the mid-80's, but these days many televisions have an RCA female composite video input connector which

works fine with the Atari.

You may find an Atari Monitor Cable where the video signal carried on the second RCA connector is not the composite video signal, but the composite luminance signal. These cables are for use with monochrome composite video monitors.

The ideal Atari Monitor Cable includes 3 RCA male connectors on the output end, carrying the sound signal, the composite luminance signal, and the composite chrominance signal. Only the best composite monitors include separate chrominance and luminance inputs. Commodore produced many fine monitors of this type, popular with Atari users.

Lonnie McClure provides this information on suitable Commodore monitors:
1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*, 1084**, 1084S**

* The 1902A used a DIN connector for chroma/luma, which makes cabling a bit more of a problem. The composite and audio connectors are standard RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN connector for chroma/luma connections, like the 1902A, while some used standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902 shares the same slightly rounded front case design as the 1080 and 2002, while the 1902A is has a rather square case design, and was manufactured by Magnavox (as were some of the 1084 and 1084S versions).

The separate composite chrominance and luminance signals that the Atari puts out comprise what the world has since come to call Y/C video or S-video. S-video connectors are normally Mini4. It is possible to build a cable, or purchase several adapters, that can allow you to utilize the separate Y/C signals generated by the Atari with a television (or other display device) that provides a standard S-video Mini4 input jack. This is the ultimate display option for the 8-bit Atari.

Adapters also exist that will take in composite video or s-video, and output a conversion of the signal as a standard VGA video signal. With such a device, the 8-bit Atari can be used with a standard PC VGA monitor.
One such adapter is the Cheese Video Box, from TV One, http://www.tvone.com/
An earlier popular device was the JAM!! from AIMS Lab.

Subject: 3.1) What are the Atari 410, 1010, and XC12 Program Recorders?

The Atari Program Recorders provide storage and retrieval of programs and data on cassette tape. In addition to the digital track that stores computer data, a second audio track is provided to play music or voice as the program runs.

Data transmission rate: 600 bits per second.
Data storate capacity: 100,000 bytes per 60-minute cassette.

Track configuration: 4 track, 2 channel (digital data and audio track)

410 Program Recorder
- early Japan version had a carrying handle
- most versions made in Hong Kong
- 410a--Taiwan version
- permanent SIO cable - must end SIO daisy chain
- power - plugs directly into wall

1010 Program Recorder
- Chelco version has Stop/Eject, then Pause buttons
- Sanyo version has Pause, then Stop/Eject buttons
- two SIO ports

XC11 Program Recorder
XC12 Program Recorder
XCA12 Program Recorder -in same case as XC12...Poland
CA12 Program Recorder -in same case as XC12...Poland
image: http://romualdl.multimania.com/images/atari/ca12.jpg
XL12 Program Recorder -XC12 w/slight changed design. Czech/Slovak/Poland
XC13 Program Recorder -XC12 which was "T2000 ready". Czech/Slovak/Poland

---

Subject: 3.2) How do I run a program from cassette?

To run an Atari BASIC program from cassette:

1. Place the cassette in the recorder.
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position where the program is located.
3. Boot the computer to the Atari BASIC READY prompt.
4. There are several possibilities for the next step, depending on how the program was saved, and whether you want to run the program or just load it into RAM. Enter one of the following four commands:
a. CLOAD loads programs saved with CSAVE
b. LOAD "C:" loads programs saved with SAVE "C:"
c. ENTER "C:" loads programs saved with LIST "C:"
d. RUN "C:" loads&runs programs saved with SAVE "C:"

] Relative efficiency of the three cassette tape recording techniques:
] CSAVE/CLOAD - most efficient - fastest saves/loads - tokenized files
] SAVE "C:"/LOAD "C:" - middle efficiency - middle speed - tokenized files
] LIST "C:"/ENTER "C:" - least efficient - slowest - straight ATASCII

5. The computer will "beep" as a signal for you to press PLAY on the recorder.
6. Press the RETURN key on the computer keyboard, and the program will load into the computer.
7. Press STOP on the recorder when loading has finished.
8. Unless you entered RUN "C:" above, now enter the command: RUN

To run an Atari BASIC or machine language program from cassette upon startup:

1. Place the cassette in the recorder
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position
where the program is located.
3. Turn on the computer while holding down the START key.
But if your computer has Atari BASIC built-in and you're running a machine
language program, hold down both the START key and the OPTION key.
4. The computer will "beep" as a signal for you to press PLAY on the recorder.
5. Let go of the START/OPTION button(s).
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading is complete and the program is
running.

Subject: 3.3) What are the Atari 810, 1050, and XF551 Disk Drives?

The Atari Disk Drives provide storage and retrieval of programs
and data on 5.25" floppy disks.

==> Atari 810 --- a 5.25" floppy disk drive
The least common denominator for the Atari. Single-Sided, Single-Density:
FM 40 tracks x 18 sectors/track x 128 byte/sector = 90K capacity
19.2Kbps transfer rate. 288RPM.
The 810 includes a 6507 microprocessor.
Shipped with DOS I (very early) or DOS II Version 2.0S
earlier MPI version- push button door opening for disk access
later Tandon version- lift door, like a garage door disk access
two SIO ports
accessories from Atari:
CX8100 Atari 810 Blank Diskettes (5 per box)
CX8111 Atari 810 Formatted Diskettes II (5 per box)
CX8202 Atari 810/815 Blank Diskettes (5 per box, certified for double density)

Third-party upgrades for the 810:
810 Archiver -- copy many copy-protected programs
Happy 810 -- Happy Backup, Warp Speed 52Kbps, 18 sector buffer
810 Fast Chip by Binary 10%-40% faster
810 Turbo by Neanderthal Computer Things (NCT) -- double-density
see: http://www.qnet.com/~dons/810T.html

==> Atari 1050 --- a 5.25" floppy disk drive
Same as the 810, plus Dual-Density capability:
Single-Sided, Single-Density, 810 compatible
Single-Sided, Dual-Density, otherwise known as "Enhanced Density" because it
is not true double-density:
MFM 40 tracks x 26 sectors/track x 128 bytes/sector = 128K capacity
19.2Kbps transfer rate. 288RPM
The 1050 includes a 6507 microprocessor.
Shipped with DOS II v2.0S, DOS III, or DOS 2.5
DIP switches: Black & white left: Drive 1
Black right, white left: Drive 2
Black left, white right: Drive 3

Black & white right: Drive 4
Third-party upgrades for the 1050:
ICD US Doubler SS SD/ED/DD UltraSpeed (US) 54Kbps, sector skewing
Happy 1050 SS SD/ED/DD Warp Speed 52Kbps, 36 sector buffer,
Happy Backup. also read/write 180K 5.25" MS-DOS floppies
CSS Super Archiver SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
CSS Super Archiver II SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Cheer-Up 1050 SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Speedy 1050 SS SD/ED/DD Warp Speed 55-57Kbps (Happy clone)
Super Speedy 1050 SS SD/ED/DD Warp Speed 55-57Kbps (Happy clone),w/180K RAM
SuperMax 1050 SS SD/ED/DD UltraSpeed 52Kbps (US Doubler clone)
Lazer 1050 SS SD/ED/DD Warp Speed and UltraSpeed 54Kbps

Rich Mier professes:
You've been plugging and unplugging the SIO cable with the 1050 power pack plugged in, right? That's a no-no. Most of the time it's Okay, but about 1 in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right, rear of the main board. A 14 pin DIL chip. Actually it is an array of 5 transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be ON on the CPU. The problem has to do with the secondary winding of the Power Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it 'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

==> Atari XF551 --- a 5.25" floppy disk drive
Single-Sided, Single-Density, 810 compatible
Single-Sided, Enhanced-Density, 1050 compatible
Single-Sided, Double-Density:
MFM 80 tracks x 18 sectors/track x 256 bytes/sector = 360K capacity
Writes "backwards" to the second side of the disk, rendering it incompatible with existing third-party 180K formats on the reverse side of the disk.
High speed 38400 bps burst mode usable only with SpartaDOS X, SuperDOS 5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2.
Rotaton rate: 300RPM.
Shipped with DOS 2.5 or DOS XE.
DIP switches: Both dips down: Drive 1
Left down, right up: Drive 2
Left up, Right down: Drive 3
Left and Right up: Drive 4
Chinon-built XF551-cannot read/write/format backside if no timing hole
Mitsumi-built XF551--can read/write backside if to timing hole, if formatted
Third-party upgrades for the XF551:
CSS XF Single Drive Upgrade--3.5", 720K floppy drive replacement
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFsingdrup.htm

CSS XF Dual Drive Upgrade--add 3.5" drive w/o losing the 5.25" drive
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFdualdrup.htm
CSS XF551 Enhancer--overcomes sensor for index hole, create flippy disks
see http://www.nleaudio.com/css/products/XF551enh.htm
CSS XF Update--replace drive OS, adds UltraSpeed
see http://www.nleaudio.com/css/products/XFupdate.htm

Subject: 3.4) What other floppy disk drives can I use with my Atari?

Major contributors to this section: Glenn M. Saunders, Tomasz M. Tatar,
James Bradford, Konrad M. Kokoszkiewicz, Don Schoengarth, Andreas Magenheimer

SS=Single-Sided SD=Single-Density, 90K/disk side
DS=Double-Sided ED=Enhanced-Density, 128K/disk side
DD=Double-Density, 180K/disk side

Printer port=has a standard Centronics printer port,+ maybe a print buffer
Master=includes drive controller, can add additional,non-Atari-specific drives

Top transfer rate=19.2Kbps unless stated otherwise

Floppy disk drives designed for the 8-bit Atari computers:
Atari 810 SS SD
Atari 1050 SS SD/ED
Atari XF551 DS SD/ED/DD, 38.4Kbps burst mode
Access Unlimited ATAR88-1 SS SD master
Access Unlimited ATAR40-1 SS SD/DD master

Subject: 3.5) What kinds of 5.25" floppy disks can I use with my Atari drives?

Russ Gilbert writes:
If you're talking standard computer store, you can't use those 5 1/4" disks. I mean you can't use high density disks. They must be double density to use with the 1050. Almost all double density 5 1/4" disks have a hub ring, high density disks don't have the hub ring.

RHamiIton5 elaborates: (5/12/01)
The Atari 8 drives do not have write heads and circuity which can handle the type of oxide coating used on the high density floppy media; they cannot write reliably to them. The hub ring has just become a sort of marker to distinguish the high density from the standard double density diskettes.

Way back in your apple days of '79-'82, most disks were hubless and only the really premium brands offered hubs to prevent slippage and out of round problems; you could even buy little kits for adding you own hub rings.

When the home computer swell really hit around '83 and price wars began, hub rings became common on good disks and eventually became standard down to include most generic bargain diskettes.

The introduction of high density 5.25's required a different coercivity (= magnetizability) to get more bits in a smaller space and suitable electronics to do it. These disks were produced hubless; was it a differentiating label or just unnecessary because of stronger mylar construction? Anyone?

Subject: 3.6) How can I use a hard drive with my 8-bit Atari?

Atari never produced hard drives for the 8-bit Atari, but a variety of options have been produced over the years. No common DOS version was written with drives the size of hard drives in mind, and very few 8-bit Atari users have owned hard drives for the Atari. Yet, if you're serious about it, a hard drive can make a tremendous addition to your system!

A couple of these options are hard drives designed specifically for the 8-bit Atari computers; the rest are interfaces designed to let you attach an industry standard SASI, SCSI, or IDE type hard drive. Customized software (OS, DOS) is often involved as well.

Larry White contributed to some of these descriptions.

==> Corvus hard drive (10 megabytes)
Attaches via joystick ports 3 & 4 on the Atari 800 only.

See: http://www.atari-history.com/corvus.html

==> K-Products/Supra controller board and SupraDrive (10 MB)
Some limitations on drive type and size and total number of drives in sys.
Attaches via PBI, or ECI with adapter.
See: http://www.atarimagazines.com/v5n6/Supradrivefor8Bit.html
Maybe still available from Bob Klaas?

==> BTL Hard Disk System
BTL 2001 Connector for 600XL/800XL PBI
BTL 2002 Connector for 130XE/800XE/European 65XE ECI
BTL 2004 SASI Hard Disk Adapter
See: http://www.atarimagazines.com/v5n12/BTLHardDisk.html

==> Multi I/O (MIO) interface, by ICD. Includes:
- Parallel printer interface
- Serial interface, for modem or serial printer. will handle 19.2Kbps
- 256K or 1 MB RAM, for RAMdisk or printer spooler
- SASI/SCSI interface, supports up to 8 controllers.
Limited to drives with 256-byte sectors.
Attaches via PBI, or ECI with adapter.

==> CSS Black Box interface
RS-232 Serial Modem Port (19.2Kbps) w/ hardware flow control,
Parallel Printer Port,SASI/SCSI Hard Disk Port, Operating System Enhancements,
optional 64K printer buffer. Supports drives with 512-byte sectors.
PBI/ECI device. Available: http://www.nleaudio.com/css/products/black.htm

==> SmartIDE project by Bob Woolley
Uses 256 of the normal 512 byte sectors. Point-to-point wiring project.
http://www.redshift.com/~cdyson/smartide-1.html

==> IDE Hard Drive Interface 1.0
By Konrad M. Kokoszkiewicz and Jacek Zuk
PBI device. Logical sector length: 256 or 512 bytes
Availability???

==> Fine Tooned Engineering (FTe) Multi I/O II (MIO II) interface
An IDE interface. Several exist, but it was never really released

==> msc-IDE Controller
created by Steve Birmanns and Matthias Belitz
* real device for the parallel-port (PBI/ECI) of the Atari XL/XE
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* software partially supports CD-ROM and ZIP drives.
Sold out.
http://www.birmanns.de/atari/

==> Gary Morton's BadSector"A" Project
Wants to connect his IDE drive to the SIO bus.
http://www.alma.demon.co.uk/Atari/AtariProjects.html

==> MyIDE interface and software by Mr Atari, Sijmen Schouten
Point-to-point wiring project. Different units for 800 and XL, including a
cartridge version for the XL.
http://www.atari.myweb.nl/hardware.htm

==> SIO2IDE, by Marek Mikolajewski
Available as a PCB or finished unit. 800 or XE/XE.
Limited to SIO speeds, but with no disk latency (as with APE/SIO2PC)
http://www.atari.cuprum.com.pl/sio2ide.htm

==> Nathan Hartwell's IDE projects
http://www.magelair.com/

Subject: 4.1) What are the Atari 820, 822, and 825 Printers?

The following printers were produced by Atari and styled to match the 400/800
computers.

Atari 820 Printer:
- 40-column impact printer
- 5x7 dot matrix
- 40 characters per line, upper & lower case alpha
- horizontal and vertical alphanumeric characters
- 6507 microprocessor, 6532 RAM I/O chip, 2K ROM
- 40 characters per second
- uses Standard Roll Paper/adding machine paper

Atari 822 Thermal Printer:
- 37 characters per second
- 10 characters per inch
- 40 characters per line, upper/lower case and point graphics
- 5x7 dot matrix

Atari 825 80-Column Printer (= Centronics 737)
- 3 character sets:
monospaced 7x8 dot matrix at 10 characters per inch
monospaced condensed at 16.7 cpi
proportionately spaced Nx9 dot matrix at avg of 14 cpi (N=6..18)
- all characters can be elongated (printer double width)
- characters per line: 80 at 10 cpi; 132 at 16.7 cpi
- speed: 50 cps at 10 cpi; 83 cps at 16.7 cpi; 79 cps avg. proportional
- print buffer: 1200 dot columns
- paper: roll, fanfold, or cut sheets
- requires Atari 850 Interface Module or equivalent

Subject: 4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?

The following printers were produced by Atari and styled to match the XL series computers.

Atari 1020 Color Printer:
- 4-color graphics: (black, red, blue, green). optional 8-pen rainbow package
- alphanumberics and X,Y plotting capability
- 10 cps (40-column mode)
- 20, 40 and 80-column modes
- horizontal and vertical alphanumerics, English and International chr sets
- water soluble ink pen technology
- 4-pen barrel print head
- microprocessor
- paper: standard roll paper (40 column width)
- AtariGraphics cassette software included

Frank McKenney writes: The printer/plotter mechanism for the Atari 1020 is (I believe) the same one used in the Tandy/Radio Shack CGP series and the Commodore 1520(?), and was made by a company named ALPS.

Atari 1025 80-Column Printer: (= Okidata ML80)
- 40 cps (80-column 10 cpi mode)
- 5 cpi expanded (40 col), 10 cpi (80 col), 16.7 cpi condensed (132-col)
- 5x7 character dot matrix
- buffer: 132 chrs at 16.7 cpi, 80 chrs at 10 cpi
- paper: roll,fanfold,single sheets. optional:roll paper holder, tractor feed

Atari 1027 Letter Quality Printer: (= Mann-Tally Riteman LQ.)
- fully formed characters, prestige elite 12)
- 12 characters per inch (80 columns)
- 20 characters per second
- single sheets or roll paper

Atari 1029 Programmable Printer (by Seikosha)
- 7-pin dot matrix, same as Commodore MPS-801
- Released for Europe only

Subject: 4.3) What are the Atari XMM801 and XDM121 Printers?

The following printers were produced by Atari and styled to match the XE series computers.

Atari XMM801 Printer:
- 80 columns, dot matrix
- friction feed or pin feed
- pica 10 cpi, double width pica 5 cpi, elite 12 cpi,double width elite 6 cpi, condensed 16.5 cpi, double width condensed 8.25 cpi
- Ribbon: Commodore 1526 and the Mannesman-Tally Spirit 80

Atari XDM121 Printer:
- 80 column, daisy wheel--letter quality
- underlining, subscripts, superscripts
- friction feed paper
- Ribbon: Silver Reed CF130, Olivetti ET201,ET221,Nu-Kote NK136

Subject: 4.4) What other printers can I use with my Atari?

This section, when written, should include information about:

- Non Atari brand printers that can be attached directly via SIO.
- Attaching parallel/serials printers via the Atari 850 Interface or equivalent
- Attaching parallel printers via the Atai XEP80 Interface
- Using modern inkjet printers with the Atari
- Using modern laser printers with the Atari

Contributions eagerly invited!

Subject: 5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?

A MODulator/DEModulator translates digital information from your computer into
acoustic tones that can be sent and received via standard telephone lines.

Atari 830 Acoustic Modem: (= Novation 'CAT')
- a stand-alone, acoustically coupled, frequency shift keying (FSK) modem
- up to 300 bits per second
- Bell 103/113 modem compatible
- requires Atari 850 Interface Module or equivalent

Atari 835 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible

Atari 1030 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible
- built-in ModemLink software.
- 2 SIO ports

Atari XM301 Modem:
- direct-connect
- 300 bps
- Bell 103/113 modem compatible
- with XE Term disk software
- permanent SIO cable, must be at end of SIO chain
- draws its power from the computer via SIO

Atari SX212 Modem:
- SIO & DB25 RS232 serial ports, must be at end of SIO chain
- 1200 baud
- Bell 103/113/212A modem compatible
- rarely with SX-Express! disk software.

Subject: 5.2) What should I know about modems and the Atari?

Thanks to Bob Puff and Clay Halliwell for helping me with this section.
But I'm still not real confident about the accuracy here. I'd love for
anyone to help me fix up this section!

There are three types of modem protocols: modulation protocols, error
correction protocols, and compression protocols. The international
standards for these protocols are laid down by the branch of the United
Nations known as the ITU-TSS (formerly the CCITT). ITU standards are
known by their "V-Dot" names. They're only names, don't try to apply
any meaning to the names.

Modulation protocol standards, the major ones
(bits per second)
300 bps - V.21 (103J is used instead in the USA)
1200 bps - V.22 (212A is used instead in the USA)
2400 bps - V.22bis
9600 bps - V.32
14.4 Kbps - V.32bis
28.8 Kbps - V.34

Error Correction standard:
V.42 - requires either software or hardware flow control

Compression standard:
V.42bis - requires V.42, and hardware flow control.

If your modem is capable of V.42bis compression, set your communications
software to enable hardware flow control. If your terminal interface
allows you to set the terminal<->modem (DTE) and modem<->modem (DCE)
baud rates separately, you should set the DTE rate to the maximum
allowed. If the DTE and DCE cannot be set separately, set the terminal
baud rate at four times the maximum actual data rate of your modem
(V.42bis achieves a compression ratio of up to 4:1). Examples: If a
V.22bis/V.42bis modem is used, set the terminal for 9600 baud. If a
V.32/V.42bis modem is used, set the terminal for 38400 baud. If a
V.32bis/V.42bis modem is used, set the terminal for 57600 baud.

Let's define a "high-speed" modem as a modem capable of V.42bis compression.
(Some 2400 bps modems, and all modems faster than that)

Using high-speed modems on the Atari

Unless you're using a CSS Black Box or a patched MIO, the 8-bit Atari
RS232 interfaces do not support hardware flow control. (I have heard
that the P:R: Connection does too, but it can't be controlled in
software.) So we must send the modem a command to tell the modem not to
use it. Using a Hayes-compatible modem, the modem command AT &K4 will
enable software flow control, and disable hardware flow control. AT &K0
will disable all flow control.

The MIO patch, HyperSpeed by Len Spencer, is available at:
http://members.aol.com/lenspencer/atari8.htm

Question. Why does my modem report V.42bis is used even when my terminal it set for the same speed as my modem?

Cause the modem will do what you tell it. You've configged it to talk at the highest speed, using LAP/M, and compression. Even if you connect modem to modem at 14.4k, you can be talking to the modem at 300 baud, and it will still use everything. You'll undoubtedly drop bytes, but hey...

Question. Why does V.42bis compression appear to function after I have sent the modem the AT &K4 or AT &K0 commands? And knowing the Atari doesn't support hardware flow control?

Compression doesn't have to have flow control to work. Same as above - its just an added step that the data goes through. Note that if the modem's input buffer is small, you can overrun it easily if you send it data faster than it can digest and send. That's why you -really should- be using flow control with compression... But it's not a necessity.

Question. Why does V.42 error correction appear to work even when I have disabled flow control with the AT &K0 command?

Question. Why don't I have problems performing binary downloads when I have software flow control enabled? (flow control characters could appear in data stream accidentally)

Depends on the protocol. Zmodem accounts for spurious XON/XOFFs. Xmodem and Ymodem don't. Also, you are able to digest the data as fast as the modem is giving it to you, hence no flow control is happening. I suspect it would be a different case if you were uploading using a streaming protocol like Ymodem G.

More tips, from Clay Halliwell:
On 11 Feb 1996, Marc G. Frank said:

> I'm having problems getting a modem attached to my Atari 850 to
> communicate at 9600 baud. When I set my communications program to 2400
> baud, everything works fine. However, when I set it to 9600 baud, the
> modem echoes my characters but doesn't act on them. That is, at 2400,

The problem with the 850 is that some of them (like mine) don't produce a PERFECT 9600 baud signal. As a result modems can't train on it, and while they will echo characters back, for some nitpicky reason they won't pick up on the "AT" attention code.

The solution is to do all your dialing at 2400 baud, but set the S37 register to force the modem to try to connect at 9600. Then switch your Atari to 9600 after connecting.

Jon Melbo responded to me in 1997:

>I have a Zoom 2400bps V.42bis modem, connected through a P:R:Connection. I
>need to do the
>at&k4 no matter what I'm dialing into, and no matter what comm program I'm
>running.
>
>Nobody's ever really been able to explain it to me, but I know it has helped a

>few other people. Try it!

What &K4 does is select XON/XOFF flow control. Apparently, all/most atari serial interfaces or at least R: handler software does not support hardware (CTS/RTS) handshaking (selected on the modem via &K3 which is also a default). Anyway, that's why the &K4 setting helps a lot.

Glenn Saunders responded to other writing of Jon's, 4/5/97:
: 28.8 CARRIER connects are possible BB or no, it's just that there is
: no point in having your modem do data faster than your puter can.

It simplifies modem configuration to let the modems connect at their native speeds.

: Right! But you should never have your DCE to DCE speed exceed your
: DTE to DCE speed. Never, unless you like errors and strange behavior.
: With a BB, one should use CTS/RTS flow control, and force the modem to
: operate at a maximum of 19.2 PERIOD (this means disable compression).

It doesn't really matter. CTS/RTS can throttle the I/O down as much as it needs to. The faster modem will wait for I/O without any complaints. Disabling compression isn't a good idea because it will disable it for ALL calls including 9600 or 14.4 users in which it could do some good even on an 8-bit BBS. Software flow control is pretty much dead in telecommunication, and has been dead as long as data compression has been standard since the stop and start commands take way too long to register that way.

: If using some other serial interface, I would use software flow
: control, disable data compression on the modem, force the modem to a
: max speed of 9600bps, and experiment with error correction. Does

This combination is deadly for most modern users unless they degrade their modem via reconfiguration. And if users have to do this, odds are they will stay away rather than futz with AT settings to get a reliable connect. That's why I think the MIO essentially died as a viable BBS interface when 14.4s became standard. They won't work well unless the "mythical" hardware flow control of the thing is enabled in some way.

An explanation of XON/XOFF from Eric Sokolowsky, 4/11/97:

I looked in my modem manual, and the at&k4 command enables XON/XOFF flow control, which is a form of software flow control. As I understand it, when a XOFF is sent by the receiving end of a line, the sending end holds off sending for a little while to give the receiving end a chance to catch up. When the receiving end catches up, it can send a XON which tells the sending end to continue sending. Using this should reduce the liklihood of dropped characters. It's not as good as hardware (RTS/CTS -- check out the FC light on most high-speed external modems on fast transfers) flow control (enabled by default or the at&k3 command), but it's good enough for the Atari, which as I understand, doesn't normally allow hardware flow control, unless using

such a device as the Black Box.

to which Robert Ely responded:

Just a quick addition. If you are using a modem at 9600bps or faster,
don't use xon/xoff, use the RTS/CTS. Since you can do this with the MI/O
and BlackBox, use it for all it's worth. If you are on an 850 or
P:R:Connection, you won't be able to deal with it and probably won't be
going at or above 9600bps anyway.

Subject: 6.1) What is the Atari 850 Interface Module?

Atari 850 Interface Module:
- early design all metal (black) case
- most in plastic beige case
- four 9-pin serial EIA RS232C ports
- One 15-pin 8-bit parallel Centronics-type port
- programmable baud rate on any port, including:
75, 110, 134.5, 150, 300, 600, 1200, 1800, 2400, 4800, and 9600 bps;
baudot speeds of 60, 66, 75, 100 words per minute
- uses standard ASCII. Baudot support for radio-teletype (RTTY).

Subject: 6.2) What is the Atari XEP80 Interface Module?

This text written by Thomas Raukamp.

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from David A. Paterson.

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit

parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 6.3) What accessories did Atari produce for their 8-bit computers?

This should be a complete list of Atari "CX" accessories, two or three digit numbers, marketed for use with the 8-bit computers.

CX30-04 Paddle Controller Pair
CX40-04 Joystick Controller Pair
CX40 Single Joystick Controller
CX41 Joystick Repair Kit
CX22 Trak-Ball
CX23 Kid's Controller
CX24 Pro-Line Joystick
CX42 Remote Control Wireless Joysticks
CX50 Keyboard Controller Pair
CX70 Light Pen (beige; the original Atari light pen)
CX75 Light Pen (+ Atarigraphics cartridge)
CX77 Touch Tablet (+ AtariArtist cartridge)
CX78 Joypad (shipped with the 7800 in Europe)

CX80 Trak-Ball
CX81 I/O Data Cord (5 ft)
CX82 Monitor Cable (Black and White Monitor)
CX85 Numerical Keypad (+ software Handler on diskette)
CX86 Printer Cable (included with 825 Printer)
CX87 Interface/Modem Cable (included with 830 Acoustic Modem)
CX88 Interface/Terminal Cable (null modem)
CX89 Monitor Cable (Color Monitor)
CX418 The Home Manager Kit (Personal Financial Management, Home Filing Manager
-or- Family Finances, The Home Filing Manager)
CX419 The Bookkeeper Kit/Atari Accountant (The Bookkeeper disk, CX85 keypad)
CX481 The Entertainer (Star Raiders, (Missile Command or Pac-Man), 2 joysticks)
CX482 The Educator (410, BASIC cart., States & Capitals cassette)
CX483 The Programmer (BASIC, BASIC Ref. Manual, BASIC Self-Teaching Guide)
CX484 The Communicator (850, 830, TeleLink I cart.)
CX488 The Communicator II (835, TeleLink II cart.)
????? The Arcade Champ (Pac-Man, Qix, 2 joysticks, cartridge storage case)
????? The BASIC Tutor I (Inside Atari BASIC book,Invitation to Programming 2&3)
CX852 8K RAM Memory Module (for 800 computer)
CX853 16K RAM Memory Module (for 800 computer)
XG-1 Light Gun (+ Bug Hunt cart.)

Subject: 6.4) What "vaporware" computers/peripherals were never released?

For definitive information on unreleased Atari products, see:

Atari Historical Society, http://www.atari-history.com/ (Curt Vendel)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
600 early 600XL, all black case, joyports on the left, missing PBI
800XL brown prototype
800XLD low-cost 1450XLD,no modem&speech,include disk drive controller&FREDDIE
800XLCR Cost Reduced, with CGIA chip ("Keri"), which is a combined GTIA&ANTIC
900XLF early name for 65XE
1250XLD Earlier name for the 1450XLD
1400XL brown prototype
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" drives (controller not included)
1450XLD 1400XL plus 5.25" floppy drive (Epson SD521 360K disk drives)
1600XL Amiga/Amiga-like.Now appears that 1850XLD was the model name for this
1650XLD to use 1450XLD case and 1200XL keyboard
1850XLD "Mickey" Atari clone of the Amiga Lorraine
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMY sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D. some were produced!
1027 PLUS -daisy-wheel, 80 columns
1053 -looks like a 1050, but supports DS/DD 360K format
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -"SweetPea" Z-80 CPU, 64K RAM, CP/M 2.2, 80 col display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor (Goldstar)
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -XE Thermal Color Printer

Subject: 6.5) What are the power requirements for my Atari components?

Thanks to Matthias Belitz for the European
data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have.

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output).
The power (in voltamps or watts) and current (in amperes) specifications
of the original equipment as presented here should be regarded as
minimum values. Higher-than-specified power and current capacities are
entirely usable, and often preferable because such supplies run cooler
and last longer.

Direct Current (DC):
Power (in watts) = current (in amps) * voltage (in volts)

Alternating Current (AC):
Apparent Power (in voltamps) = current (in amps) * voltage (in volts)
Effective/True Power (in watts) = current (in amps) * voltage (in volts)
* (cosine of the angle of lag)

N O R T H A M E R I C A: INPUT = 115-120 V AC, 50/60Hz
==========
9 V AC 5.4 VA (600 mA) Atari#CO62195/CO17539 transformer:

5 V DC 1.5 A (7.5 W) Atari#CO61763-11 adapter:
600XL,800XL,65XE,130XE,800XE,XE Game System
two ones with the same part number, but different cases and different
input Values :#1, 65XE (Poland, made in Taiwan), Input 22 VA
#2, 800XL, Input 26 VA
8.5 V DC Atari#CO61605 adapter:
600XL,800XL,65XE,130XE,800XE,XE Game System

These draw their power from the SIO +5 V:
XM301 (60 mA),XC11,XC12,ICD P:R:Connection,Wizztronics MidiMax,RVerter

Draws power from the 600XL PBI:
1064

These have built-in power supplies (plug directly into the wall):
410,815,820,825,1025,1029,XMM801,XDM121

OTHER:
The ICD Multi I/O (MIO), all versions, can use both AC and DC supplies, BUT:
stick to voltages of at least 6.2-7.2 V.
Rana 1000: 9 VAC & 3.4 AMPS

Subject: 7.1) What versions of the Atari Operating System (OS) are there?

Most of this section by permission from:
http://www.student.kun.nl/f.offenga/atari.htm

Atari 8-bit Operating Systems
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Version 3.3, 6/27/1999.
By Freddy Offenga (mailto:F.Offenga@student.kun.nl)

400/800 10kB OS roms
~~~~~~~~~~~~~~~~~~~~

Rev.	TV	Date	CRC-32	Part Nr(s)
A	NTSC	(?)	(?)	(?)
A	PAL	(?)	0x72b3fed4	CO15199, CO15299, CO12399B
B	NTSC	(?)	0x0e86d61d	CO12499B, CO14599B, 12399B
B	PAL	(?)	(?)	(?)

XL/XE 16kB OS roms
~~~~~~~~~~~~~~~~~~

Rev.	System	Date	CRC-32	Part Nr(s)
10	1200XL	10/26/1982	0xc5c11546	CO60616A, CO60617A
11	1200XL	12/23/1982	(?)	CO60616B, CO60617B
1	600XL	03/11/1983	0x643bcc98	CO62024
2	XL/XE	05/10/1983	0x1f9cd270	CO61598B
3	800XE	03/01/1985	0x29f133f7	C300717
4	XEGS	05/07/1987	0x1eaf4002	C101687

(?) This information is missing. If someone can supply this info,
please write me an e-mail.

NOTES:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).
The 1200XL contains two ROMs for the OS (8k each), XL/XE's use a single
16k ROM and the 16k XEGS OS is stored in a 32k ROM (together with 8k
BASIC and 8k for Missile Command).

Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and

rev.A is mentioned in the rev.B source code.
400/800 rev.A PAL All info found in two Atari 400's and Atari 800
ROM module CX801.P
400/800 rev.B NTSC Information from a ROM dump and the rev.B source
listing. The part numbers were listed in the
catalog from 'Best Electronics'. According to
'Mapping the Atari' rev.B ROMs have a 'B' at the
end of the part number, therefore I figure these
part numbers are from rev.B.
400/800 rev.B PAL Could exist, since the NTSC version exists and
there's some conditional PAL/NTSC assembly in
the rev.B source code
1200XL rev.10 PAL/NTSC All info found in an Atari 1200XL. The XL/XE
rev.2 source code refers to it as rev.10.
'Best Electronics' calls it rev.A.
1200XL rev.11 PAL/NTSC Refered to rev.11 by the XL/XE source code.
'Best Electronics' calls it rev.B.
XL/XE rev.1 All info found in an Atari 600XL
XL/XE rev.2 All info found in an Atari 800XL
XL/XE rev.3 All info found in an 800XE
XL/XE rev.4 All info found in an Atari XE Game System

O.S. Authors and dates
~~~~~~~~~~~~~~~~~~~~~
The following info is from the Atari XL/XE rev.2 source code.

Revision A (400/800)
D.Crane / A.Miller / L.Kaplan / R.Whitehead

Revision B (400/800)
Fix several problems.
M.Mahar / R.S.Scheiman

Revision 10 (1200XL)
Support 1200XL, add new features.
H.Stewart / L.Winner / R.S.Scheiman /
Y.M.Chen / M.W.Colburn 10/26/82

Revision 11 (1200XL)
Fix several problems.
R.S.Scheiman 12/23/82

Revision 1 (600XL/800XL)
Support PBI and on-board BASIC.
R.S.Scheiman / R.K.Nordin / Y.M.Chen 03/11/83

Revision 2 (600XL/800XL)
Fix several problems.
R.S.Scheiman 05/10/83
Bring closer to coding standard (object unchanged)
R.K.Nordin 11/01/83
~~~~~~~~~~~~~~~~~~~~~

Vapour-ware
~~~~~~~~~~~
The following OS roms originate from rare Atari 8-bit systems.
Since I don't own any of these (unfortunately), I don't have much
information about these roms. Who can help me?

I've got two 16K rom dumps from the 1450XLD. Both ID's are rev.3.
The first dated 3/23/1984 comes from the 'Pooldisk Too' CD-ROM
(filename: 1540os3.v0) and the second dated 6/21/1984 was send to
me by Nir Dary (filename: os1450.128). Main differences between
these two are in the first 3K ($C000 - $CBFF).

The XL/XE OS rev.3B is from an Atari from Arabia. It's probably based
on rev.3. There are changes in the fonts (Arab characters) and several
patches in the code. More info at:
http://www.savetz.com/vintagecomputers/arabic65xe/

Rev. Found in Size CRC-32 Date
~~~~ ~~~~~~~~ ~~~~~ ~~~~~~~~~~ ~~~~~~~~~~
3 1450XLD 16kB 0x0d477aa1 3/23/1984
3 1450XLD 16kB 0xd425a9cf 6/21/1984
3B 65XE 16kB 0xf0a236d3 7/21/1984

~~~~~~~
Special thanks to Nir Dary for the rev.2 source code, rom dumps and
the 1200XL. It's in good hands.

~~~~~~
More info on what is maybe either the 1985 or 1987 XL/XE OS versions listed
above. From ST*ZMAGAZINE #36, Sept. 1, 1989 (as reprinted in PSAN Nov 89):
by Mark Elliot, Innovative Concepts
The following changes have been incorporated in the 130XE computer.

The O.S. has minor changes like:
A) The MEMORY TEST (from SELF TESTS) tests the extra 64K now! (in 4 squares)
B) Also, the MEMORY TEST checks the first 48K over TWICE as fast as before!
C) The KEYBOARD TEST has the F1-F4 keys missing on top. (function keys),
although the code that interprets them is probably there (like XEGS).
D) Also, it types out "COPYRIGHT 1985 ATARI" at the keyboard test, when all
tests are done. (compared to COPYRIGHT 1983 ATARI, before)
E) And, the O.S. chip itself, is on a 27256 EPROM, but only half of it is
~~~~~~

used! (comprared to the original, which was on a 16K x 8 ROM, 27128 comp.
~~~~~~
james adds (3/8/01):
Your faq, regarding OS Rev A, states:
Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.

Did exist! My parents bought me an Atari 400 w/ 410 back in 1981 for
entertainment when I was badly injured in a motorcycle accident. A
year or so later I paid good money ($40 USD or so?) to have the OS A
upgraded to OS B.

Subject: 7.2) What is the ATASCII character set?

ASCII is an acronym for the American Standard Code for Information
Interchange. Pronounced ask-ee, ASCII is a code for representing English
characters as numbers, with each letter assigned a number from 0 to 127. For
example, the ASCII code for uppercase M is 77. Most computers use ASCII codes
to represent text, which makes it possible to transfer data from one computer
to another.

The 8-bit Atari computers use a modified version of the ASCII character set
called Atari ASCII, or ATASCII.

David Moeser produced this nice translation table.
Piotr Fusik corrected the description of Atari character 5.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)

Subject: 7.3) What versions of Atari BASIC are there?

There were three versions of Atari BASIC produced: A, B, and C.

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga adds:
You can also take a look at the part numbers on the IC's
inside your Atari and compare them with the numbers from
the following table:

Part# Version
~~~~~~~~~~~~~~~~~~~~ ~~~~~~~~
CO12402 + CO14502 A
CO60302A B
CO24947A C

On versions A, B, and C, Greg Miller writes:

"Rev A had a number of bugs, not just the commonly
described crash bug. Rev B fixed most (maybe all, I don't remember) of
these, but in the process, they added a new bug. You see, the crashes
were caused by a bug in one of OSS's memory move routines. When the bug
was fixed, the fix mistakenly applied to a routine that actually worked
in Rev A, causing the new lockup problem.

Rev C differs in only a few bytes. AFAIK, the only change was to remove
the alteration made to the routine that was broken by Rev B.

You can get more details from the annotated source listing published by
Compute! books. Bill Wilkinson described many of the problems in detail.
He also talked about it in his column in Compute! magazine."

Wally Lang adds:

--- Warner's Atari issued Rev B in two formats:
(1) As a built-in Basic on 600XL and 800XL computers.
(2) As a special request order item for 400/800 and 1200XL computers.

--- Tramiel's Atari issued Rev C in both formats for XE series computers and
ALL previous Atari 8-Bit Computers.

Subject: 7.4) What are Atari DOS I, DOS II v2.0S, DOS III, DOS 2.5, and DOS XE?

Here are short descriptions of the various Disk Operating Systems (DOS)
versions produced by Atari for use with their 8-bit computers.

The original Atari DOS shipped with all 810 disk drives from 1979-1981. It
consists of a single file, DOS.SYS, which is loaded into memory from disk on
startup.
At the top of the menu screen it reads:
~~~~~~~~~~~~~~~~~~~~

DISK OPERATING SYSTEM 9/24/79
COPYRIGHT 1979 ATARI
Unless you are a collector, you probably have no reason to work with DOS I.
The DOS I disk is labeled: Atari 810 Master Diskette (CX8101).

DOS II Version 2.0S was shipped with all 810 disk drives, and early 1050 disk drives, from 1981-1983. It consists of two files:
DOS.SYS is loaded into memory from disk on startup
DUP.SYS, which contains the DOS menu, is loaded only when needed.
MEM.SAV can be employed to preserve the contents of memory to disk when DUP.SYS is loaded, so that the data can be restored to memory when exiting from the DOS menu. DOS 2.0S supports Atari's proprietary single-sided, single density 90K 5.25" floppy disk format only. DOS 2.0S represents the lowest common denominator of Atari DOS versions--you can be assured than any Atari disk drive for the 8-bit Atari can work with disks formatted with DOS 2.0S.
The DOS 2.0S disk is labeled: Atari 810 Master Diskette II (CX8104).

DOS II Version 2.0D was shipped with the rare Atari 815 Dual Disk Drive.
This is the double density version of DOS 2.0S.
The DOS 2.0D disk is labeled: Atari 815 Master Diskette (CX8201).

DOS III shipped with 1050 disk drives from 1983-1985. It was created in part to take advantage of the 1050's Dual-Density capability, by employing a single-sided, enhanced-density 128K 5.25" floppy disk drive format. Atari called this format "dual-density," but the Atari community quickly came to refer to this format as "enhanced-density" to better differentiate it from widely available 3rd-party truly double density disk drives and supporting versions of DOS. DOS III uses a disk format incompatible with DOS 2.0S. It included a utility to convert files from DOS 2.0S to DOS III, but not back again. It used disk space less efficiently than DOS 2.0S. For these reasons and others, DOS III was not widely accepted by the Atari community, and like DOS I is not generally used except for curiosity's sake.

DOS 2.5 shipped with 1050 disk drives and early XF551 disk drives from 1985-1988. DOS 2.5 represented Atari's relenting to the masses, returning to DOS 2.0S compatability. DOS 2.5 very closely resembles DOS 2.0S, with just a few features added. It supports both DOS 2.0S single-density 90K formats, as well as an enhanced density 128K format for use with the 1050 disk drive. DOS 2.5 also includes a RAMdisk utility for use with the 128K 130XE computer, a utility to convert files from DOS III disks back to DOS 2.5, and other disk utilities. DOS 2.5 is just about as universal among Atari users as DOS 2.0S.

DOS XE shipped with XF551 disk drives from 1988-1992. Like DOS III, DOS XE introduced a whole new format for Atari floppy disks; but unlike DOS III, DOS XE also preserved general compatability with DOS 2.0S/2.5. DOS XE supports the full capabilities of the double-sided, double density 360K per 5.25" floppy disk XF551 disk drive, including that drive's high-speed burst mode. DOS XE also fully supports the 90K SS/SD capability of the 810 disk drive, the 128K SS/ED capability of the 1050 disk drive, the 180K SS/DD capability of most 3rd-party disk drives for the Atari, and a RAMdisk for use with the 130XE. Date-stamping of files is supported. DOS XE requires an XL or XE computer; it is not compatable with the 400/800 computer models. Even though

DOS XE was critically well-received, and represented a substantial jump in capabilities over DOS 2.5, its arrival came so late in the crouded realm of Atari and 3rd-party DOS versions that it never achieved much acceptance among real users, and is now relegated to the same status as DOS I and DOS III before it. Before its release, DOS XE was widely known as "ADOS."

Subject: 7.5) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8 drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum. Complete documentation about the disk formats and commands, as well as the source code, is available. MyDOS 4.53/3 was released by David R. Eichel on 12/31/89.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g and 3.2gx are disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS 3.3a and 3.3b were rewritten by Stephen J. Carden for use with BBS Express PRO!. SpartaDOS 3.3c is produced on a 16K ROM cartridge from Video 61.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2g)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek.
(it is pronounced "Bay Vay Dos")

Carolyn Hoglin adds:
I didn't see TOP-DOS mentioned anywhere. This superior DOS was written by R. K. Bennett of Eclipse Software in Sunnyvale, CA. It was based on Atari DOS, but with many, many more features. It fully supports my double-density, double-sided Astra drives, automatically sensing the proper density and sidedness of both drives 1 and 2. (MYDOS only seemed to do that on drive 1.) Also supported are large ramdisks for Axlon, Mosaic, etc. The latest version was TOP-DOS 1.5+, which came with an excellent manual explaining how to use its powerful capabilities.

Any other versions of DOS all 8-bit Atari users should be aware of??
- SuperDOS 5.1
- BiboDOS 5.x

Subject: 7.6) How do I modify Atari DOS to support more than two drives?

Russ Gilbert writes:

DOS 2 type DOSes default to two drives.
Boot DOS and BASIC.
? PEEK(1802)
if it is 3 then you only recognize two drives.
To get the 3rd drive, poke 1802,7. Then go to dup.sys (type DOS)
and write system files. Next time you boot that DOS, you'll recognize
3 drives.
If you want four drives, poke 1802,15.

Subject: 7.7) Are there Graphical User Interfaces (GUIs) for the Atari?

Contributors: Andreas Magenheimer (5/12/01), Mathy van Nisselroy (5/12/01)

- Diamond GOS version 1 (PD disk version), version 2 (cart), version 3 (cart); plus some applications (painter program, text program, etc.); Diamond GOS has been made freeware by the author Alan Reeve;

- G.O.S., the Graphic operating system by Total Control systems; two different versions are avaiable (I call them GOS 1 and GOS 2) and they are PD;

- G.O.E., the Graphic Operating Environment also by Total Control Systems (this one merely works under Sparta DOS, not with Bewe-DOS and not at all with DOS 2.x); so far I have found 3 different versions (GOE 1,2,3) with some applications (graphic/painting program, etc.); PD;

- S.A.M., the Screen Aided Management (unfortunately it has the same name as SAM, the software aided mouth) from PPP/Germany. It is avaiable in two different versions: a) the type-in listing from Atari magazin and/or the Lazy finger disks (which are PD!) or b) the commercial version 2.0 which has many add-ons and can still be bought from Dean Garaghty/UK or PD-World-Versand/Germany; This GUI merely works correct under DOS 2.5 and Medium/dual density, however...

- BOSS-XL, the XL-Desktop from Mirko Sobe; written in Turbo-Basic; freeware; http://www.atarixle.de/

- BOSS-XE, the XE-Desktop from Mirko Sobe; written in Turbo-Basic;freeware, http://www.atarixle.de/

- BOSS-X the newest desktop version from Mirko Sobe, needs an 128k+ Computer (128k or more memory), supports MyDOS up to 16MB and MyDOS subdirs...; still written in Turbo-Basic; many applications and drivers; freeware; http://www.atarixle.de/

- XL-TOS a small and "cheap" GUI version from Atari magazin (i.e. a type-in listing; the basic file, which consists of many data lines creates a short object code file); unfortunately this GUI only looks good, it loads almost nothing... PD;

- ST-TOS a small basic program, that looks like a GUI; it can merely load Basic files and do a few DOS commands, like lock, unlock, delete and such... (PD)

- Basic desktop, a GUI written in Basic just as a sample, what can be done with an 8-bit computer; this one loads basic and text files (maybe also ML files); PD;

- DCS, the desktop construction set from Tom Hunt; there are 3 different versions avaiable, a) for DOS 2.5, b) for MyDOS andc) for Sparta-DOS; I have tested the Sparta DOS version, which worked with batchfiles and could easily load some ML files, text files and basic files (which were already on the DCS disk); it also works with high densities and/or hard disk partitions up to 16MB and supports subdirs of course; hmm, freeware or shareware ?!?

- ATOS - GUI by Tom Hunt/Closer To Home. http://cth.dtdns.net/atos/

- there are a lot more GUI programs, however many of them are written in Basic or Turbo Basic and are very restricted; most of them merely look like a GUI but need to much memory for everyday use. Thats why most users still prefer those DOS or Gamedos (Gameloader, Multiloader, etc.) programs...

Subject: 8.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal programs available.

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
http://www.cs.huji.ac.il/~itayc

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

Subject: 8.2) What BBS software can be used on the Atari?

Contributors to this section: Winston Smith, Steven Sturza, Chad Hendrickson,
Don Fanning.

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
The AMIS BBS was written in BASIC by people from the
Michigan Atari Computer Enthusiasts. It included designs for a ring-detector.

You needed a sector editor and had to allocate message space by hand, hex byte by hex byte.

Steven Sturza adds:
The AMIS BBS was written by people from the Michigan Atari Computer Enthusiasts.

o TODAMIS 1.0, for 1030/XM301, Copyright (C) 1986 Trent Dudley
Don Fanning writes:
TODAMIS was a spin off of AMIS written by Trent Dudley (of AMODEM fame).

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed in BASIC and was somewhat crashy. I think that this is the great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer writes:
FoReM BBS derived from an early AMIS. When multiple message areas were added the name was extended to FoReM 26M. Then, When OSS released BASIC XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most of the Assembler routines (where is he now?).

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE cartridge in order to run. It is in the public domain and can import and export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only, control ATASCII graphics are reserved for message data-structure bytes). FOREM-XE BBS is still currently in use as we speak, and may be reached via the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in effect.

o Forem-XE Pro -- by Len Spencer. http://members.aol.com/lenspencer/

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported features such as intra-line editors. Unfortunately, the coding of the ABBCS was really poor. You could practically blow on your keyboard and crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston, Massachusetts, USA, area. I'm not sure whether his BBS for the Atari 8-bit has been placed into the public domain or not. This BBS was the first to support a RAMdisk, which Paul Swanson called a "V:" device for "virtual disk". This BBS was written in Atari BASIC and required a joystick hardware "dongle" device. This was notable as being one of the first Atari 8-BIT BBSes that could actually go for a week without having to be rebooted. Pointers to the message base were kept in an Atari "very long string" (for which Atari BASIC is famous). The BBS would only have problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"
rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o BBS Express! Professional -- a product of Video 61, www.atarisales.com
http://cth.dtdns.net/pro/pro1.html

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that
performs networking. There was an OASIS network between Boston,
Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word
of the OASIS IV developers reaches the network from New Zealand or Canada.

o OASIS IV -- a product of ???

o Frank Walters BBS -- I know nothing about this BBS except that Frank
Walters wrote it.

o Carina BBS -- a shareware product of Shadow Software.

Subject: 8.3) What programming languages are available for the Atari?

Contributors: Freddy Offenga, Kevin Savetz.
Based upon a file located at http://www.student.kun.nl/f.offenga/atari.htm

==========
!!!! This section is under construction - HELP WANTED !!!!

The goal is to give information about all available languages
for the Atari 8-bit computer. This information will include:
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Freddy Offenga, mailto: F.Offenga@student.kun.nl
==========

There are quite a lot! To get some structure in this section it's
divided into the following categories;

a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

The following format is used:

- Language title (medium)
version, year : version, year
author/company : author/company
available..... : where/how to get it
package..... : programs, documentation
features..... : main features
Description.

The question marks (?) indicate that more information is
required about that topic.

Definitions:
umich University of Michigan Atari archive

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- A bunch of manuals
- Some copy-pasted lines from the Atari 8-bit newsgroup

a) ASSEMBLER

- 130XE+ Makro Assembler (disk)
version, year : 2.2, 1992
author/company : Torsten Karwoth
available..... : freeware, ?
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros

Two pass 6502 assembler with integrated menu, editor
and monitor shell. Needs extra RAM banks. Source
format is derived from Atmas Makroassembler.

- A65 (disk)
version, year : ?, 1989
author/company : Charles Marslett, WORDMARK Systems
available..... : freeware, ?
package....... : assembler, manual
features...... : source include
Two pass 6502 assembler. Source format is based on the
Atari Macro Assembler. Assembler source included.

- Alfasm, Turbo-Assembler/16 (disk)
version, year : 1.0, 1990
author/company : Jeff Williams, DataQue Software
available..... : ?
package....... : assembler, docs
features...... : source include
Two pass 6502/65816 assembler.

- Atari Assembler/Editor (cart)
version, year : ?, 1981
author/company : Atari
available..... : ?
package....... : assembler, editor, monitor, manual
features...... : -
Two pass 6502 assembler with integrated editor/monitor

- Atari Macro Assembler (disk)
version, year : 1.0C, 1981
author/company : Atari
available..... : ?
package....... : assembler, editor, debugger, manual
features...... : macros, source include
Two pass 6502 assembler.

- Atmas Makroassembler (disk)
version, year : 2, 1985
author/company : Peter Finzel, Hofacker
available..... : ?
package....... : assembler, editor, monitor, manual
features...... : macros
Two pass 6502 assembler with integrated editor/monitor.

- Bibo Assembler (disk)
version, year : ?, 1986
author/company : Compy-shop
available..... : ?
package....... : assembler, editor, monitor
features...... : source include, data include
Two pass 6502/65c02 assembler with integrated editor/

monitor.

- Datasm/65 assembler (disk)
version, year : 2.0, 1981
author/company : DataSoft Inc.
available..... : ?
package....... : assembler, editor, menu, manual
features...... : -
Two pass 6502 assembler.

- EASMD (disk)
version, year : 1.0, 1981
author/company : OSS
available..... : ?
package....... : assembler, editor, monitor
features...... : ?
Two pass 6502 assembler with integrated editor/monitor.

- Fast Assembler (disk)
version, year : 1.5, 1995
author/company : MMMG Soft
available..... : ?
package....... : assembler, editor, disassembler
features...... : ?

- Kasm65 (disk)
version, year : 2.41, 1994
author/company : Ken Siders
available..... : shareware, umich
package....... : assembler, editor, linker, docs
features...... : macros, relocation, source include,
conditional assembly
Two pass 6502 assembler. Relocatable object files are
compatible with ra65. Source format is derived from
the Atari Macro Assembler.

- MAC/65 Macro Assembler (disk|cart)
version, year : 2.00, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package....... : assembler, editor, monitor, manual
features...... : macros, source include
Two pass 6502 assembler with integrated editor/monitor.
Mac/65 is a direct descendant of the Atari Assembler/
Editor (via EASMD).

- MAE (disk)
version, year : .96, 1996
author/company : John Harris
available..... : umich
package....... : assembler, menu, editor, monitor, docs
features...... : macros, source include, data include,

conditional assembly
Two pass 6502/65816 assembler with integrated editor/
monitor. Extra RAM supported.

- NASM65 (disk)
version, year : ?, 1992
author/company : Nat!
available..... : ?
package..... : assembler, linker, librarian
features..... : macros, relocation, source include
One pass 6502 portable cross assembler (initially for
the ST). Highly compatible with MAC/65.

- PC-65 (disk)
version, year : 1.0 beta, 1996
author/company : Jan Feenstra & Freddy Offenga
available..... : mailto: F.Offenga@student.kun.nl
package..... : assembler
features..... : macros, source include, data include,
boundary directive
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.

- Quick Assembler (disk)
version, year : 1.0, 1990?
author/company : JBW, Avalon?
available..... : ?
package..... : assembler, editor, menu, debugger
features..... : source include
Two pass 6502 cross assembler with integrated editor.
Very user friendly menu environment.

- Ra65 (disk)
version, year : 1.0, 1989
author/company : John R. Dunning
available..... : public domain, umich
package..... : assembler, linker, librarian
part of cc65 (c-compiler)
features..... : ?

- Synassembler (disk|cart)
version, year : ?, 1982
author/company : Steve Hales, Synapse Soft
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : source include
Two pass 6502 assembler.

- ST-65 (disk)
version, year : ?, 1991
author/company : A. Stauffenberg, F. Offenga
available..... : mailto: F.Offenga@student.kun.nl

package..... : assembler, menu shell, manual
features..... : macros, conditional assembly,
source include, data include,
boundary directive
Two pass 6502/65c02 cross assembler for the Atari ST
written in 68000 assembly. As far as I know this is
the first assembler with the boundary directive.

- X-Assembler
version, year : 2.4, 2001
author/company : Piotr Fusik
available..... : freeware, mailto: fox@scene.pl
package..... : assembler, docs
features..... : conditional assembly, source include,
binary include, pseudo commands,
pseudo addressing modes
Two pass 6502 cross assembler for PC. The source
format is backward compatible with Quick Assembler.

b) BASIC

- A BASIC Compiler (?)
version, year : 1.03, ?
author/company : Monarch Data Systems
available..... : ?
package..... : BASIC compiler
features..... : ?

- Advan BASIC (disk)
version, year : ?, ?
author/company : Advan Language Designs
available..... : ?
package..... : BASIC compiler
features..... : ?

- Atari 800 Basic (disk)
version, year : 1.0, 1981
author/company : Microsoft
available..... : ?
package..... : ?
features..... : ?

- Atari BASIC (cart)
version, year : Rev.C, 1983
author/company : Atari
available..... : standard ROM in Atari XL/XE
package..... : BASIC interpreter, manual
features..... : pretty plain BASIC implementation

- Atari Microsoft BASIC II (cart)
version, year : ?, 1991
author/company : Atari

available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC A+ (disk)
version, year : 3.05, 1981
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC XL (cart)
version, year : ?, ?
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC XE (cart)
version, year : ?, 1985
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- Turbo Basic XL (disk)
version, year : 1.5, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package....... : BASIC interpreter, compiler (V1.1)
features...... : ?
Published in the German magazine "Happy Computer".

c) C

- ACE C (disk)
version, year : ?
author/company : John Palevich & Ralph Walden
available..... : ?
package....... : ?
features...... : ?
This is a newer version of 'Deep Blue C'.

- C/65 (?)
version, year : ?
author/company : OSS
available..... : ?
package....... : ?
features...... : ?
Probably derived from Dr.Dobbs "Small C". Compiles to 6502
code which emulates the 8080 instruction set.

- C65 (?)
version, year : ?
author/company : Keith Ledbetter
available..... : ?
package....... : ?
features...... : good macro assembler
This compiler does not support structs.

- CC65 (disk)
version, year : 1989
author/company : John R. Dunning
available..... : www.cc65.org
package....... : compiler, linker, assembler, librarian
features...... : ?
Public domain compiler. Also used as cross compiler.
Relocatable object linkage files, and the most thorough
K&R C for the 8-bit. Comes with an relocatable assembler.

- CC8 (disk)
version, year : 2.3
author/company : John Palevich & Steve Kennedy
available..... : ?
package....... : Compiler
features...... : ?
ACE C with more "real" C support (e.g. arrays of pointers
to structs). Requires ACE C runtime libs and linker.

- Deep Blue C (disk)
version, year : 1.2, 1982
author/company : John Palevich, APX
available..... : http://www.atariarchives.org/APX/showinfo.php?cat=20166
Source code "Deep Blue Secrets" downloadable at
http://www.atariarchives.org/APX/showinfo.php?cat=20179
package....... : Compiler, Linker
features...... : ?
Deep Blue C was originally an independent product, but it
then became available from APX. It converts C to pseudo-
code and then interprets the pseudo code (8080 instruction
set emulation).
Drawn from Ron Cain's public domain C-compiler (Small-C).

- DVC C (disk)
version, year : 1.05, 1985
author/company : Ralph E. Walden
available..... : ?
package....... : Editor, Compiler, Optimizer, Linker
features...... : Quite user friendly program
The compiler generates special object files (.CCC)
which can be optimized and linked. The package uses a
special DOS called DVC DOS which contains runtime stuff.

- LightSpeed C (disk)
version, year : 1.08, 1986

author/company : Clearstar Softechnology
available..... : ?
package....... : Compiler, Optimizer, Linker
features...... : ?
Runs under CLI DOS's and MENU DOS's.

- Tiny-C
version, year : ?
author/company : OSS
available..... : ?
package....... : ?
features...... : ?
First sold C compiler by OSS. This compiler was used to
compile itself! First true language "bootstrap" on any
8-bit machine (it was also available for Apple and CP/M
machines). Derived from Dr.Dobbs "Small C". Compiles to
6502 code which emulates the 8080 instruction set.

d) PASCAL

- Atari Pascal (disk)
version, year : 1.0, 1982
author/company : APX
available..... : APX-20102
Information at http://www.atariarchives.org/APX/showinfo.php?cat=20102
package....... : ?
features...... : ?
Needs two drives.

- Draper Pascal (disk)
version, year : 2.1, 1989
author/company : Norm Draper
available..... : ?
package....... : ?
features...... : ?

- Kyan Pascal (disk)
version, year : 1985,1987
author/company : Kyan Software
available..... : ?
package....... : editor, compiler, linker, macro-assembler
and manual
features...... : ?
versions: 1)64K XL/XE version supports 130XE RAMdisk 2)400/800 version

e) LISP

- INTER-LISP/65 (disk)
version, year : 2.1, 1981
author/company : Special Software Systems, DataSoft
available..... : ?
package....... : ?

features..... : ?

f) FORTH

- ValForth (?)
version, year : ?
author/company : Valpar International
available..... : ?
package..... : ?
features..... : ?

- Extended fig-Forth (disk)
version, year : version 2.0 is dated 1/15/1982. An earlier version
(exact version number not known) is dated 11/10/1981
author/company : Patrick Mullarky, APX
available..... : APX-20029
http://www.atariarchives.org/APX/showinfo.php?cat=20029
package..... : ?
features..... : ?

- fig-Forth (disk)
version, year : 1.4s
author/company : ?
available..... : ?
package..... : ?
features..... : ?

- fun-Forth (disk)
version, year : ?
author/company : Joel Gluck, APX
available..... : APX-20146
http://www.atariarchives.org/APX/showinfo.php?cat=20146
package..... : ?
features..... : ?

- Grafik-FORTH
version, year : ?
author/company : ?
available..... : ?
package..... : ?
features..... : ?

- QS Forth (?)
version, year : ?
author/company : Quality Software
available..... : ?
package..... : ?
features..... : ?

g) PILOT

- Atari PILOT (cart)
version, year : 1980

author/company : Atari
available..... : ?
package....... : ?
features...... : ?

h) LOGO

- Atari LOGO (cart)
version, year : 1983
author/company : LCSI, Atari
available..... : ?
package....... : ?
features...... : ?

i) All the rest

- Action! (cart)
version, year : 1983
author/company : OSS
available..... : ?
package....... : compiler, editor, monitor and library
features...... : fast compiler which generates good code
Needs cartridge for runtime procedures. A PD runtime
library is also available.
All variables are static, so recursive routine calls
are not possible. No floating point type (though a
PD library should make this possible). No arrays of
objects (arrays of POINTERS to objects are possible).

- Quick (disk)
version, year : 2.0, 1990
author/company : Raindorf Soft
available..... : ?
package....... : ?
features...... : ?
This is the "poor man's Action!". Same restrictions as
Action! apply also to Quick. Further restrictions are:
only simple assignment expressions, no records and no
pointers.

- Test Computer Language (disk)
version, year : 2.2, 1985-1990
author/company : D.Firth
available..... : public domain, ?
package....... : compiler and editor
features...... : ?

- Extended WSFN (WSFN = Which Stands For Nothing)
version, year : ?
author/company : Harry Stewart, APX
available..... : APX-20026
package....... : ?

features..... : ?
Info at http://www.atariarchives.org/APX/showinfo.php?cat=20026

Subject: 8.4) What cartridges were released for the Right Slot of the 800?

Contributors: Gene, Larry White, others

Austin Franklin Austin 80 Console Software
Eastern House KISS
Eastern House Monkey Wrench
Eastern House Monkey Wrench II
Geminisoft/Sar-An Magic Dump
Geminisoft Magic Dump II
Radical Systems Cartridge Maker (eprom burner)
Block (first right cart/first "backup" program hardware device)
R-Time 8 ICD (battery-backed clock, for left or right cart slots)

Subject: 8.5) What games support 4 or more simultaneous players?

contributors to this section:
Jeff M Lodoen, Vidar \"Hawk\" Olavesen, Pat Mulvey,
Steven E. Posey (Party Quiz controllers description), Andreas Magenheimer

The following games support 4 player head-to-head play. Remember, only the
400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor,
Thorn EMI Soccer, Major League Hockey

The following support 8 players on the 400/800 or 4 on the other computer
models, using the 2 controllers-per-port CX30 Paddle controllers:

Super Breakout, Worms?

The following supports 4 players on all machines, using special 4-button keypad
controllers linked together with RJ-11 jacks (standard phone jacks) to a box
with 2 joystick port connectors.

Party Quiz by Suncom

Andreas Magenheimer contributes the following:
- Networking 1-8 players/computers games:
Dataque once (1989-1992) developed a Network game+cable which lets you
connect 1-8 A8 computers together. The cable (octagon or so) could be
selfmade or bought. The game avaiable was Maze of Agdagon (shareware
from the Agda Group/Dataque). Maze of Agdagon worked on all 8Bit Ataris
with a minimum of 48k RAM. In 1999/2000 Bewesoft discovered this and
developed the game Multidash which is network-compatible to the previous
game, i.e. it can use the same network cable. But, because of its
interlaced grapic mode Multidash will only run on XL/XE computers.
Therfore Jiri included a good Gr. 8 picture how to built an easy network

cable for 2 players/computers (using a SIO cable as a nullmodem cable!)
and an -not so easy - network cable for 2-8 players/computers. The game
and its text+picture was released as freeware; it can be found on the
internet or the abbuc magazine...

in short: networking games with 1-8 players: a) Maze of Agdagon
b) Multidash

- more multi-joystick games:
MULTIJOY device by Radek Sterba (Raster), supports 8 joysticks attached to
one controller port.
Two games by Raster supporting this device: Cervi, Multris.
http://www.infos.cz/raster/atari

Subject: 8.6) What programs run only on the 400 and 800 models, and why?

The following are reported as incompatable with models other than the original
Atari 400/800. Most probably do work on XL/XE's if you use a translator to
run the original 400/800 OS on your XL/XE.

Apple Panic Broderbund

Konrad M.Kokoszkiewicz writes:

XL/XE software won't work on 400/800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Subject: 8.7) What programs make use of the Light Gun or a light pen?

Bertrand M. (LEXX) writes:

Bug Hunt, Barnyard Blaster, Crossbow, Crimebuster, Operation Blood, Operation Blood II - Special Forces (not completely sure about that one), Light Gun Blaster (PD), Gangsterville (Italian game written in BASIC), maybe a couple more...

James Bradford mentions:
"On the 400, the light gun /pen will only work in joystick port 4." This renders much light gun and light pen software unusable on the 400.

Andreas Magenheimer adds:
all Lightgun games can be used with a lightpen (which is not as accurate as a Lightgun however). And: all lightpen games can be used with lightgun. thus add:
- Atari Graphics (Atari) Lightpen graphic software
- 5 Matrix or Matrix 5, a PD game...

- Alien Invaders (DGS) a Space Invaders clone from the brits...
- Bembelwo (Thorsten Butschke) a sort of golf/minesweeper game, written
in Quick and PD!
- Sharp Shooter (Mat*Rat) a PD game from Analog, also avaiable on cart
from Video 61/Lance Ringquist
- Lightgun Shooter (ABBUC mag.) a simple shooter game, at least PD!
- Flyshot (or Flyshoot) a Turbo Basic game (PD) from ZONG, the KE Soft mag.

More:
Geisterschloss by KE Soft, 1992

Subject: 8.8) What programs have a track ball mode or support a mouse?

Contributors: Andreas Magenheimer, Mirko Sobe

Title Keystroke Required
------------- --------------------
Missile Command (Atari) CTRL-T
Slime (Synapse) [T]
Shanghai (Activision) choose controller type: ST mouse !
(plug it into port 2; if you do not
have one, you have to reboot!!)
Bombdown (Roemer of Uno) choose between Joystick, Amiga
mouse, ST mouse or CX85 numeric
keypad (use port 2 for any mice)
Minesweeper (PPP/PD-World Versand) use an ST mouse in port 2
The Brundles (KE-Soft/Kaisersoft) use an ST mouse in port 2
The Brundles Editor (KE-Soft, PD) use an ST mouse in port 2
Geisterschloss/Ghost Castle (KE-Soft, PD) choose Lightgun (port 1) or ST
mouse (port 2)
10-12 games from ZONG magazine ST mouse games !! (they use port 2
(KE SOFT, now PD) and a driver
called KEMAUS.COM)
Multi-Mouse manager (PD/shareware) drivers for mice, TB, etc.
Unriagh I (german PD adventure) has drivers for ST mouse+Joystick
(stick=port 1, mouse=port2)
Unriagh II (german PD adventure) has drivers for ST mouse+joystick
(stick=port 1, mouse=port 2)
little Calculator (AMC-Verlag, PD) uses mouse only (port 2)
big UPN calculator (PD) uses ST mouse, TB, Touch tab. and
joystick; (there are different COM
files, rename the one you wish to
use to *.EXE; all drivers use port
1 - if I remember correctly)
Operation Blood (ANG/Mirage) press mouse fire or Select to start
in ST mouse mode (port 2)
Operation Blood 2 / Special Forces press mouse fire or Select to start
(ANG/Mirage) in ST mouse mode
Sprint XL (ABBUC Jahresgabe 1992) uses an ST mouse in port 2
M.O.S. (ABBUC magazine) uses an ST mouse in port 2

Multi-(Tasking-)Operating-System,
Diamond GOS (Reeve software) Version 1.0 (disk), 2.0 & 3.0
(cart.)
support an ST mouse in port 2
S.A.M. (Power per Post) german GUI, supports an ST mouse in
port 2
G.O.E. (TCS) supports an ST mouse in port 1
BOSS-X (MS-Software, Mirko Sobe) supports ST-Mouse in Port 2

RE: Missile Command, Andreas writes:
there are many different versions avaible... I know the old Atari 800
cart version, which works correct with Joystick and Trakball, but not at
all with a mouse. The newer XL version works with Mouse, trackball and
Joystick, also the newest (built-in) XEGS version of MC. But, there is
also a tape version (and maybe a disk version) of MC avaiable. I am not
sure if this tape version behaves like the old 800 version or like the
newer XL and XE/XEGS versions...

And about mice, Andreas adds:
Maybe you did not know, there is a little difference between Trackball
and ST-mouse. Although MC works with both input devices does not mean,
they are the same. they are not !! Connect the TB to an ST computer and
you see: it does not work at all !! You have to do a small conversion to
convert the TB to an ST mouse. (Plans are avaiable from ABBUC, germany).
maybe somebody already did this with Harvey`s TB (and to make things
worse: the old Atari 800 version does not support a mouse; so if the TB
has been converted to a mouse this MC version will not work with it!).

Subject: 8.9) What programs have a paddle(s) or Koala Pad mode?

Andreas Magenheimer contributes:

- Super Breakout (Atari) breakout clone
- Live Wire (Analog) tempest clone
- Live wire 2 (Analog) tempest clone
- Planetary Defense (Analog)
- Pong (Antic) Pong clone
- Pong (Analog) Pong clone
- Super Ball (Compy Shop Magazin) Breakout clone
- Arkanoid (Taito/Imagic) Breakout clone
- Koala/Micro-Illustrator (Island graphics/Koala Ware) graphics program
- Chiseler (Antic or Analog) a breakout clone
- Slime (Synapse) a slimy shooter...
- Chicken (Synapse) catch the chicken eggs...
- many more dozens of Pong and Breakout clones
(forgot their names, maybe someone can help here!)
- many more programs (which I do not remember right now!)

Subject: 8.10) What programs have a CX85 mode?

Andreas Magenheimer writes:

- Multi mouse Management (PD)
- UPN calculator (PD)
- the Bookkeeper (published by ???)
- Bombdown (Roemer of Uno)
- many games from KE-Soft and Powersoft
(forgot their names, help needed!)

Subject 8.11) What programs have a Touch tablet mode?

Andreas Magenheimer writes:

- Atari Artist (Atari) graphics program
- Pixel Artist Deluxe 1.3 (PD) graphics program
- The Brundles (KE-Soft) Lemmings clone
- many more (which I do not remember right now!)

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: superarc.arc - both Super Un-Arc & Super Arc
suprarc2.arc - Super Arc
supunarc.com - Super Un-Arc
supunarc.uue - Super Un-Arc

location: http://www.umich.edu/~archive/atari/8bit/Archivers/Arc/

Subject: 9.3) What are the .DCM, .ATR, .XFD, .SCP, and .DI disk image formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Image format invented by Bob Puff, for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.
DCM specs at: http://home.planet.nl/~ernest/diskcomm.zip

ATR - Image format invented by Nick Kennedy, for his SIO2PC project.
Used with most 8-bit Atari emulators running on other computer platforms.

XFD - Image format invented by Emulators Inc, for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used with ST Xformer and PC Xformer emulators.

PRO - Image format invented by Steven Tucker, for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

SCP - SpartaDOS SCOPY image file.

DI - Image format invented by Kolja Koischwitz & Christian Kruger for their
800XL DJ emulator for the Atari ST.

One tool for converting among all of these disk image formats is:
Acvt v1.06 by Jindrich Kubec
Latest version can be found at http://www.asw.cz/~kubecj

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text,
but was a binary file. As a binary file, it had to be downloaded using a
file transfer protocol such as XMODEM. The use of ".xmo" as a filename
extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load
files. Like .xmo, use of .bin is discouraged.

On 10/5/01 Ron Hamilton wrote:
> Originally .COM files used the file start load address as the execution
> point; they were normally called by their name typed at the command
> processor prompt. Often these were external components of the file
> management system or similar utilities and expected to find data in
> predetermined buffers and code or pointers present from a specific DOS
> version.
>
> .EXE files used the Atari DOS 2.0 convention of appending a load segment
> containing the execution address to be placed into $2E0-1 or $2E2-3.
> Usually these were complete applications and were rarely DOS specific.

>
> .BIN files in their simplest form were just binary RAM images of data or
> code; they were not intended to execute immediately after the load.
> Multiple load stages were possible, but typically no INIT or RUN address
> was included.

Subject: 9.5) How can I make my commercial boot disk (tape, cart) into a load file or disk image?

Russ Gilbert writes:

The disk image part is a matter of taking a copyable boot disk and making an atr, xfd, dcm or other disk image type file out of it, usually for use with an emulator. Before emulators, the Bob Puff .dcm format was used to store/archive/retrieve boot disk images.

Almost all commercial software for the A8 is/was copy protected. For boot disks, this usually involved a large number of special formatting that couldn't be copied using ordinary sector copiers. Usually the boot process involved checking to see if a certain sector error occurred, then proceeding. If the error did not occur, the disk was a copy and would not work.

For carts, usually the method of protection was to write to the cart area of memory and see if the value changed. If the value changed, the cart program was in RAM, not ROM and would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption, which must be decrypted before the program can run. This to make more difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated

and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product. The APE Pro system, by Steven Tucker, in the registered version of this shareware allows making disk images called 'Pro' images. APE (Atari Peripheral Emulator) requires a cable, called the SIO2PC cable, that connects the A8 13 pin serial port to a serial port on the IBM PC clone. To make 'Pro' images, a special adapter cable is needed, not just the 'standard' SIO2PC cable. The 'Pro' image can 'capture' the copy protection of an original commercial disk. The 'Pro' image can then be loaded into an A8 using the APE registered version software, thus backing up your original

disk software. Note the 'Pro' image will only be of use to
person(s) owning registered APE software and 'Pro' adapter
cable.

Subject: 9.6) How can I convert my commercial boot tape into a cassette
image file?

Ernest R. Schreurs writes:

For those of you that like ALL classic Atari software, there is now a
way to store all software that has been recorded on cassette tapes on
the hard disk of your PC. I have written a program that is similar to
the SIO2PC utility written by Nick Kennedy. But this one is intended
for use with cassette software. You will need the following items:

Any PC equipped with a sound card and about 50 to 100 Megs of free
disk space to work with. The sound card should be able to sample sound
at a sample rate of 44.100 Hz mono. The sample must be recorded into
a .wav file.
You need the wav2cas program to convert the .wav file to a .cas file.
The .cas file is a digital cassette image file that only contains the
data that is on the cassette tape. Once you have that, you can throw
away the .wav file. The .cas files are typically 16 to 64K, so they
are relatively small.

To load cassette files into your Atari (i.e. boot a digital cassette
image) you do not need a sound card. You do need a SIO2PC cable or
similar device. You also need the cas2sio program.

The wav2cas and cas2sio programs should be available from the archives
of Umich by now. They have been put together in one zip file
wav2cas.zip, along with the documentation and the 'C' source code.
You can download it through the web interface at the URL
http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Note the capital in Emulators and in Peripherals.
Thanks to William Kendrick for helping me get it uploaded there!
You can also try the gopher stuff:
gopher://gopher.archive.umich.edu:7055/11/atari/8bit/Emulators/Peripherals/

Steven Tucker, the author of APE, has added support for this file
format as of version 1.15 of APE. It looks real neat, so try that out
too! Thanks to Steven for adding a nice user interface for these
cassette images. He did a nice job. I am hoping other using are
willing to write some programs to get more enjoyment out of this
underrated storage medium.

My stuff is available totally free for personal use, so I hope you
enjoy it. Read the docs about the conditions.

Subject: 10.1) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

Ataridsk V1.2 (c) 95-12-09 by HiassofT (Matthias Reichl)
http://www.horus.com/~hias/atari/

MyUTIL and the XF551 - tips from JTKIRK:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing
]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but
]I don't know if I will be able to modify it properly. If someone does it
]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from Hans Breitenlohner:

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)

Konrad Kokoszkiewicz answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Apparently 2.07 is buggy.
Anadisk 2.06 is available at: http://ch.twi.tudelft.nl/~sidney/atari/

Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to Preston Crow:
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first

portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 10.2) How do I transfer files using a null modem cable?

This section by Russ Gilbert.

Q: How do I connect two cmputers using a null modem cable?

A: You need a term program and RS 232 ports on both
computers. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 baud, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25 pin
port. 25 pin #2 goes to Atari #4 (XMT to RCV), 25 pin
#3 goes to #3 on Atari (RCV to XMT) and #5 of 850 goes
to #7 of 25 pin (GND to GND).

The right hand pin on the 'long' side of a female 'D'
connector is #1. There are 13 holes on this 'long'
side, 12 holes on the 'short' side. The numbers go
to the left 1 to 13 then #14 is under #1 and left again
so that #25 is under #13.

Most term programs allow a null connection, without a
carrier detect. Notably, 'Express 850' does not. I have
only used 'Procomm 2.4.3' (the last shareware version of
Procomm) on the PC and Bob Term on the Atari, but other
term programs may work.

To check your null modem connection, start both PC and
Atari term programs, set baud to 2400 or 4800 on both
computers. No parity, 8 data bits, 1 stop bit on the PC.
Be sure to use the correct COM port on the PC. Go to
'terminal' mode and you should now be able to type on
either computer and see it on the other screen. To
accomplish a file transfer, use Y-modem probably from
Bob Term, rather than X-modem. X-modem will often append
bytes to a file transfer, an undesirable event. There is
also a very nice Z-modem recieve program for the Atari,
called AtarZmodem by Larry Black for the Atari.

A convenient way to make a null modem cable, up to about
30 feet long, is to use two female DB25 connectors
(Radio Shack) some three or more conductor cable. Using
the two DB25 female connectors allows unplugging your
modems and plugging in the null modem cable into the two
modem cables. This also avoids the confusion of

variations in the computer ports. Most computers connect into the modem end via a standard RS232 DB25 connection. With this both ends 25 pin cable, you would cross pins 2 and 3 and connect the #7s together to make a null modem cable.

The SIO port on the Atari cannot be used directly. An 850, P:R: connection, MIO, Black Box or similar device that provides an RS232 port must be used.

Following are pin assignments for a DB25 pin RS 232 C port.
1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

For higher speed connections, above 4800 or 9600, you need the flow control lines and Atari term software that has flow control built in. You also need an MIO or Black Box, which uses the PBI (parallel bus). A high speed cable would need not only XMT, RCV, and GND, but also flow control lines. I suggest a commercial null modem from computer store to ensure correct lines. A null modem is a small adapter with the correct lines already crossed. I don't know how to correctly connect the CTS, RTS, DTR, DSR, CRX lines for a high speed null modem. With a null modem, you just plug it into the 25 pin connectors of the two modem cables you might already have connected to your Atari and PC or Mac. You may need a straight thru 25 pin gender changer also.

Following is in this FAQ elsewhere, but I summarize here: (Figure out or look for pin numbers on the ports.) Note that these are pin assignments, and NOT null modem connections with the XMT, RCV crossed and GND straight thru.

Atari 8-bit PC AT 25 PC AT 9 pin
---
1. DTR 20 4*
2. CRX 8 1*
3. XMT 2 3
4. RCV 3 2*
5. GND 7 5
6. DSR 6 6
7. RTS 4 7
8. CTS 5 8

9. No connect? shield RI
22 RI

Note: * above indicates the difference between an AT 9 pin
and a Atari 8-bit 9 pin cable connector. eg. If you check
continuity from pin 3 of 25 pin end and it goes to pin
4 of nine pin end, you have an Atari serial cable. If pin
3 of 25 pin goes to pin 2 of 9 pin end, you have a PC
serial cable.
(updated 3/1/99)
(DTE = Data Terminal Equipment ie. your computer.
DCE = Data Communications Equipment ie. your modem.)

Subject: 10.3) What is SIO2PC?

From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC
compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari
programs could be stored on the PC's hard (or floppy) drives. It turned out to
be quite successful. About 95% of my work was in the software, but a hardware
device to convert logic levels was also necessary. This device is now commonly
referred to as an SIO2PC cable.

Features:

Emulates 1 to 4 Atari disk drives

Store your Atari files on PC hard or floppy drives

Boot from the PC, real drive not needed to start-up

No software or drivers required for the Atari;
no conflicts: use your favorite DOS

Twice as fast as an Atari 810 drive and more reliable

Co-exists with real drives in the Atari daisy chain

Compatible down to the hardware level: use sector copiers, etc.

Print-Thru captures Atari print-out and routes to PC's printer

Convert Atari files to PC files and vice versa

1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy
http://www.cswnet.com/~nkennedy/

Another source for building SIO2PC cables is Clarence Dyson's page at
http://www.redshift.com/~cdyson/atari.html

Subject: 10.4) What is the Atari Peripheral Emulator (APE)?

David A. Paterson writes:

"Steven J. Tucker took SIO2PC one better and wrote new software. The Atari Peripheral Emulator (APE for short) lets your PC act as high-speed drives. It lets you print to your PC printer. And it lets you use your PC modem on the 8-bit."

The APE ProSystem goes even further. The ProSystem has two components:

- The program PROSYS.EXE is used to create the protected and unprotected disk images which are then used by APE.

- The ProSystem hardware is a device designed to allow direct connection of a stock 1050 disk drive directly to a PC for use by the PROSYS.EXE software.

APE home page: http://www.atarimax.com/

Subject: 11.1) How did Atari get its name?

Graham Thornton types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are theirs, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it

alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong(r).

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 11.2) What is the History of Atari?

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor.

ATARI BASIC: (according to Atari BASIC Sourcebook)
Paul Laughton and Kathleen O'Brien - Most of Atari Basic
Paul Krasno - Helped with Trnscendental routines
Bill Wilkinson - Designed Floating Point Scheme
Bob Shepardson - Modified IMP-16 Assembler to accept special syntax tables
Paul invented
Mike Peters - Key punching and operating

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

This extremely long URL leads to Atari's patent for the 8-bit Atari computer:
(thanks Rick Cortese)
http://164.195.100.11/netacgi/nph-Parser?Sect1=PTO2&Sect2=HITOFF&p=2&u=/netahtml/search-bool.html&r=94&f=G&l=50&co1=AND&d=pall&s1=atari.ASNM.&OS=AN/atari&RS=AN/atari

All Atari computers are tested at the factory by a master computer called the Atari Sentinel System.

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(
Atari Games Corporation is also formed from the former coin-op division and markets coin-operated games under the Atari Games brand.

Atari Games inherits Atari copyrights/trademarks/patents for use in the coin-operated arcade video game market only.

Atari Games was acquired by Midway Games on March 29, 1996.

January 2000: Atari Games is renamed Midway Games West, and games produced by the group will sport the Midway Games brand. The last coin-op game with the Atari Games logo: San Francisco Rush 2049, released in 1999.

June 22, 2001: Midway Games announces it is exiting the coin-operated arcade video game market; its game development efforts will now be focused on games for home game platforms.
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system.

1992
Atari (US) officially dropped all remaining support of their 8-bit computer line on January 1, 1992. (Some 800XE's were still being manufactured in China in 1992.)

1996
On July 31, 1996, Atari Corp. became a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which is a subsidiary of Hasbro, Inc., for $5 million in cash.

(JTS filed for Chapter 11 Bankruptcy Protection on December 11, 1998, and then converted it to Chapter 7 on February 28, 1999)

Hasbro Interactive produced games for several platforms, including PCs
running MS-Windows. Some of Hasbro's games, including several re-makes of
classic Atari titles, were marketed under the Atari label. The Atari
Interactive brand was termed "a Hasbro Affiliate."

Games produced by Atari under Hasbro ownership included:
Atari Arcade Hits 1 & 2, Breakout, Centipede, Frogger, Glover,
H.E.D.Z. - Head Extreme Destruction Zone, Missile Command, Nerf ArenaBlast,
Pong, Q*Bert, The Next Tetris, Atari Greatest Hits

2001
On January 29, 2001 Infogrames Entertainment announced completion of its
acquisition of Hasbro Interactive from Hasbro. The purchase included the Atari
titles and intellectual properties.

TODAY
Atari is a brand of Infogrames.

Infogrames, Inc. develops video games for all consoles (Sony, Nintendo and
Microsoft), PCs, and Macintosh systems. Infogrames' catalogue of more than
1,000 titles includes award-winning franchises such as Alone In The Dark(TM),
Civilization(TM), Deer Hunter(R), Driver(TM), Roller Coaster Tycoon(R), Test
Drive(R), and Unreal(R), and key licenses including Survivor(TM), Warner Bros.
Looney Tunes(TM), Nickelodeon's Blue's Clues(TM), Dragon Ball Z, Mission
Impossible(R), Harley-Davidson(R), Major League Baseball(R), and the National
Football League(R), among many others. The Company's Humongous Entertainment
and MacSoft labels are leaders in children's entertainment software and
Macintosh entertainment software, respectively.

Infogrames, Inc. is a majority-owned subsidiary of France-based Infogrames
Entertainment SA (IESA), a global publisher and distributor of
video games for all platforms, as well as interactive digital television,
mobile smart devices (WAP, HDML) and in-flight entertainment systems. In 2001,
IESA acquired Infogrames Interactive, Inc. (formerly Hasbro Interactive),
including its line of software based on well-known licenses such as
Monopoly(R),
Jeopardy(R), Tonka(R), and Atari(R).

It sounds like "Mercenary".

Click on this link to read more about the
Mercenary game I come to think of.

http://www.zzap64.co.uk/zzap11/mercenary.html

The link is about the Commodore version, but the
screenshots look a lot like the Atari version I
remember.

The answer is easy. The one thing that MyDOS and Atari DOS have that SpartaDOS doesn't have are physical "next sector" links in the file structure as a linked list. If you scramble part of the disk, you can "walk the sector links" recovering as much of the file system as is recoverable. SpartaDOS use the VTOC "sector map" system. If anything should affect the VTOC, all of the files on the disk are lost unless the disk is either 1.) a virginal "write one time only" file protected image with all sectors of a file contiguous to one another (i.e. the file has never been updated), 2.) a snapshot and link map of the VTOC was taken as a precaution... there is some SpartaDOS tool that allows you to make a link map for crash recovery, but I forget what the name of it is, because in those two case the sequence or sectors is known.

I've evaluated many versions of MyDOS and what each one can't do until it's made me nauseous and the winner is: spartados. I'm going to use that until I find out what it can't do that I need. I've got a question: what's the syntax for RD and RDBASIC? I want to specify D9 but no matter what I do, it tells me "no disk specified" or something equally bad. If I've got a 256K 800XL with RamboXL in it, which should I be using?

Thanks,
John

9. Re: ATR filenames (was: It has begun...)

Source record: 32277

I think we're talking about different things here. The Atari never sees the ATR image filename. It doesn't matter what the image is named. The Emulator has to be able to understand the ATR filename. It then mounts that as an Atari disk drive, and only shows the contents, which will be the original names as the atari expects.

The only thing I can see what you said having an impact on was if someone was going to run a BBS on an atari, and put up the ATR images for download.

Perhaps one would want to download an ATR to his Atari then write it
to an actual floppy disk. A file is a file. An ATR image is a file.

>I could be a bit behind the times, but I don't know of any Atari 8-bit
>program that uses ATR images. DCM files, on the other hand, would cause

Ken Siders' great XFormer of course! It also handles DCM files.

Hi John,

For sparta 3.2g at least the syntax is just

RDBASIC Dn:

replacing the n with the drive number you want. D9: works for me.

-Dan

I would suggest you to use RamJet in stead of "RD.COM". It's coded by John K. Picken and is a very fast ramdisk-driver for Sparta-Dos and is very configurable. See my url at the bottom and go to "downloads -> Sparta-Dos External"

Note that earlier versions of Sparta-Dos don't support a "D9:" device. You need 3.2G or up for that..

Hello, John, Dan, Fox-1.
Uhm My little doc on spartados didn't correctly set the ramdisk.
This is because I never use a ramdisk. So RD D9: or RDBASIC D9:
should work for those two ramdisks, or get the one by John Picken.
Sorry John.
Or, if RD D9: doesn't work, RD D8: should work.
Russg

You can use donback.arc
Which was originally programmed by me <G>
(and with help from Dave Hall)
I don't have all my old atari disks, just the emulators these days but atari archive and other
places still have it. I've seen it around.
It'll make that snapshot of your sparta directory so you don't have to worry about it.
Just like everything else tho, using a snapshot from a year on a crashed disk from
yesterday more than likely ain't gonna work =)

23. I need HELP with 130XE sound!

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-02 10:30:33 UTC
From: me@kagfr.net
Message-ID: <3c32deff.49814665@proxy.news.easynews.com>
Source record: 32292

Recently I bought an ATARI 130XE in original box with all the cables and manuals from Ebay for $90.00! The buyer claimed it was new never been used, and he tested it and it works. I took it overseas. Then I checked the system for the first time in the Middle East. I used a multi-system TV. First I used the RF cable, but it did not work both the Picture and the Sound are BAD. Then I used the AV. Now the Picture is very clear, but the sound is crappy with a huge noise. In order to use it I need to lower the volume of my TV to the lowest level possible, and use the system without the sound. I'm wondering if someone knows what the hell is happening????

Regards,

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

29. latest and greatest OS ROM file for 130XE

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-02 13:59:56 UTC
From: Christopher Lang <christopher.lang@plus.cablesurf.de>
Message-ID: <a0v3qs$4f0$1@goliath.news.is-europe.net>
Source record: 32148

Hello,

does anybody know where I can get the 130XE ROM file which has the memory test for all the RAM built in? It seems that the last 130XE's that were shipped had that ROM.

thanks!
Chris

30. 1050 Turbo from Bernhard Engl

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-02 14:04:17 UTC
From: Christopher Lang <christopher.lang@plus.cablesurf.de>
Message-ID: <a0v431$4he$1@goliath.news.is-europe.net>
Source record: 32149

Hello,

does anybody know where I can get files for the 1050 Turbo that was sold in the old times by Berhard Engl? I think it is a ROM for the 1050 as well as some hardware docs. Does he still sell it? (Probably not ...) Are the files available somewhere?

thanks a lot!
cheers
Chris

32. AWin800 monitor syntax?

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-02 17:17:52 UTC
From: jerry_glenwright@hotmail.com
Message-ID: <2be33b6b.0201020917.3c839263@posting.google.com>
Source record: 32151

Can anyone familiar with this monitor tell me the syntax for using the SET command? I've tried various combinations of SET PC $XXXX but receive an error message (I realise I'm probably just doing something stupid here...)

Also, is it possible to single step a program from within the monitor?

Tahnks, Jerry

I might be wrong but I don't think it works (SET that is)

And no step from within the Monitor..

If you use the Omnimon Rom in place of the XL rom then it's inbuilt
monitor will allow stepping and setting of PC etc etc..

: My gut feel is to use RDBASIC over RD but I will try and find John Picken's
: version.

RDBASIC creates a ramdisk at the place were the BASIC ROM is loaded. In this
case you can't use BASIC anymore.

Another thing is, the newer versions of Sparta-Dos support an extra set of
internal commands. Usually one uses the "RD" as an external command, but in
those newer version "RD" is also an internal command (remove-dir) so you have
to:

rename RD.COM to RM.COM
or
type the full name of RD.COM (in stead of just "RD")

He is (or was) working on a new game pretty recently (utilizing the hi-color mode).
I think it was pretty impressive. If it will eventually come out I guess we'll find out
sooner or later.

I think RDBASIC would actually work with BASIC. It would only use the 8k
under the BASIC ROM so you ended up with something like a 14 sector ramdisk.
Only advantage was if you had a stock 800 XL or maybe a 65XE.

Just a week notice that there's only about a week until one of the most
important Atari scene events this year. The Alternative Party covers
everything from Vics to SGIs, from Amigas to Ataris. The weirder and rarer
the better. A three-day event with live performances by Tero Mï¿½yrï¿½nen, Happo,
CnCd, No I Ain't, Pnmf!, Analogia & Telamurska -- ambient to hard industrial.
In addition there will be DJs, plus some of the usual things you can expect at
a computer party: competitions, cool groups etc.

The party takes place in Gloria, Helsinki, Finland from January the 11th to
the 13th. More information about compos, artists and the alternative
scene in general see http://www.altparty.org/, or contact me.

The Alternative Party -- We stand for everything you don't

SD 1.x and 2.x only supported drive designators through 4 and 8
respectively; the syntax was "RDBASIC Dn:" or "RD130 Dn:" SD 3.x included
D9: and used the more general "RD Dn:". SDX uses the "DEVICE specify"
command with several .SYS files to configure its environment and defaults
the ramdisk to D9.

CES DEMO 1985 is the best demo i have come across for the Atari 8-bit systems. It shows a shaded robot marching on a 3D-like walkway and a 3D shaded spaceships with smooth scrolling starfield in the background.

Another one is a rotating Atari logo (with flying colors) and then flying swan fly by. Of course, the Bouncing balls is a classic for the Ataris.

I think this CES demo uses the GTIA graphics (graphic 9) capability.

Keeping this newsgroup alive, anybody else ever seen a nice demo for the Atari?

Mike

(got Atari VCS in 198....1)
(Atari 400 in 1982.....)
(Atari 800XL in 1984...)
(Atari ST in 1995...)
(SGI Crimson in 1992)
(Mac Powerbook in 1996)
(Octane/SSI in 2001)
(now I am into retrocomputing with Atari 8-bit, hee hee)

: 800XL with RamboXL 256K (XE compatibable)?

First, a Rambo is not fully XE compatible, but not an issue in this case...

The programs don't differ that much. Hyperspeed is slighty faster when using the less-featured-but-faster set-up. It also has external CMD's included for SysOps who run a Pro!-BBS, but I guess you don't need them. I'm using Hyperspeed on my standard 130XE and my 320XE for years now without a problem, so I would go for that one, but you may download both since MegaXE has more DOC's included.

Source record: 32179

Happy New Year Everyone:

I'm using SpartaDOS now and as some of you know have been working on a ramdisk and other things. With internal 800XL basic everything works fine, even using RD.COM D9:. When I put my MAC/65 cart in, no go. If I use OPTION to lock out basic, there's still no MAC/65 as I'm told "no cartridge" when I use "CAR". I know the cart works as I used it in MyDOS. Is there something else I'm missing? I don't think it's the RD since SpartaDOS locks up on bootup and never gets there. I can only get it going by RESET and then BASIC shows up instead of the cartridge. Is spartados not compatable with the supercartridges? My gut feel is that it is since so many people use MAC/65 and spartados from what I see on the ng.

Here's what I have: an 800XL with 256K RamboXL; SpartaDOS x33a; The standard Mac/65 cartridge. Any ideas? My real goal is MAC/65 not BASIC, but one really needs BASIC to work too.

Thanks,
John

Rick Cortese

: > RDBASIC creates a ramdisk at the place were the BASIC ROM is loaded.

: I think RDBASIC would actually work with BASIC. It would only use the 8k
: under the BASIC ROM so you ended up with something like a 14 sector ramdisk.

You could be right. Never really used anything else then an expanded Atari.
I also never use the standard Sparta-Dos Ramdisk thingies since those are very
slow.

(can't get mac65 working with spdos 3.3a)
I suspected it was 3.3a. But I set up a real Atari and checked.
It is 3.3a. Use 3.2g. It is the latest 'real' Atari ftedos. 3.3a is for
emulators. It is also sold or something by Video 61.
3.2g works with the cart.
I looked at 'Thuderdome' sysop fox site, where he has the ramdisks.
He is here and suggests the hyper one. I didn't try that, but the
RM.COM that comes with the mega one worked fine for me and
my Newell 256k. Probably any of J. Picken's will be better ramdisks
than the RD.COM that comes with f32g or x32g whichever it is.
I'm not sure which one RM.COM is, there's RM66 and RM67 and RM.
I also put in my little doc that RUN $E457 causes warmstart. Of course
it is RUN $E477.
Once you get going with SpartaDOS, I think you'll like it.
I have the SPX cart, but all the high speed stuff messes up my disks
with real disk drives and I seldom use it.

70. Another SpartaDOS doc (FTeDOS)

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-04 05:52:43 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3c3542ef$0$35621$1dc6e903@news.corecomm.net>
Source record: 32190

```
1/4/02
An FTeDOS 3.2g Reference
Russ Gilbert

SpartaDOS was originally by ICD. The rights to it were
obtained by FTe (Fine Tooned Engineering). FTe released
version 3.2g as 'registerware'. Mike Hohman, owner of FTe
would send a manual for a $20 registration, he said. FTe
has disappeared. FTeDOS 3.2g is freely distributable.
FTeDOS is SpartaDOS updated.

In making this document, I realize that some FTeDOS
commands are revised from SpartaDOS 3.2d. I've revised
some commands, there may be some I missed.

FTeDOS has internal and external commands. When you boot
FTeDOS, it has some commands available which do not require
further loading of memory and will not interfere with
whatever you have in memory. These are the internal
commands. External commands will overwrite what is in
memory, so you will need to save your work if you use an
external command. The COPY command is internal but will
wipe out program memory.

FTeDOS supports subdirectories, which are specified with a
'>'. FTeDOS supports time and date, will write current time
and date to the directory structure. You need to set the
TIME and DATE when you boot up, or use a R-TIME8 cartridge
to automatically set time.

FTeDOS 3.2G will not work in emulators, you need X33A or
X33B for use in emulators.

Any binary load file in current path named with a .COM
extension will load and run by just typing the filename
with or without the .COM extension. Running .EXE or
.BAT files require specifying the extension. Note that
you have to put the period at the end of a file that
has no extension.

FTeDOS is compatible with DOS 2/2.5 MyDOS for reading,
writing, loading or erasing files on those DOSes. Do not
try to read/write/load/erase FTeDOS files from the DOS 2
style DOSes. FTeDOS doesn't support MyDOS subdirectories.

INTERNAL COMMANDS:
```

DIR- displays files on present drive in FTeDOS format.
Supports sub-dir paths and wildcards (* and ?).
DIRS- displays filenames in DOS 2.5 format.
?DIR- displays the current path.
(CWD)- Old change directory command
CD- change the current path to a sub-directory.
eg. CD D3:GAMES
CD D3:GAMES>ARCADE
CD < (go up one directory)
note: the command line doesn't show the current
path. You have to use the ?DIR command.
(CREDIR/DELDIR)- SpartaDOS versions Create and Delete
sub-directory.
RD - Remove directory. You have to rename the ramdisk
RD.COM to something like RAMD.COM
MD - Delete an empty directory
Dx: - Set default drive. eg. D3:
CAR- leaves the command prompt and runs the cartridge.
The DOS command from BASIC will return to command
prompt.
BASIC ON, OFF- Turn internal BASIC on or off.
COPY - eg. COPY D1:*.* D3:GAMES>*.* Can be used to view
a file, but don't COPY to S:, copy to E: instead.
Use CNTRL-1 to stop scrolling.
ERASE - erase the file specified. Supports wildcards, so
be careful!
RENAME - rename a file. eg. RENAME PROG1.COM PROG2.COM
PROTECT - write protect a file.
UNPROTECT - unprotect a file.
LOCK - write protect a disk.
UNLOCK - unprotect a disk.
KEY ON, KEY OFF - turn keyboard buffer on, off. It is best to
turn KEY OFF for many binary load programs.
RUN - will execute memory at location specified. Location
must be in hex, eg. RUN E477 does a warm start.
RUN is an external command for some versions of FTeDOS.
LOAD - Loads a binary file, but doesn't run it.
SAVE - Saves an area of memory to a file.
eg. SAVE D1:MYFILE A000 BFFF
VERIFY ON, OFF - turn write verify on or off.
BOOT - write boot sectors to boot the file specified.
usually used to make a bootable disk of FTeDOS.
After you copy FTeDOS to a disk, you must do the
BOOT command to make the DOS boot.
eg. BOOT D1:X32G.DOS.
TIME - set the time.
DATE - set the date.

EXTERNAL COMMANDS: Any executable program is an external
command. A few come on the FTeDOS disk.

MDUMP - display area of memory in hex. eg. MDUMP A000.
DUMP - display a file in hex. eg. DUMP D1:FILE.EXT
XINIT - Format a disk, FTeDOS.
UNERASE - Will recover an ERASEd file if possible.
TREE - display directory tree, starting in the current directory.
AINIT - Format a disk, DOS 2/2.5. Be careful, it doesn't
ask you twice if you want to format the drive.
TDLINE - puts a time/date line at top of screen.
note: CTHTDL is a replacement TDLINE that
is Y2K correct.
RDBASIC - make RAMDISK XL/XE. eg. RDBASIC D8:, makes a
small ramdisk under built in BASIC.
RAMD - make ramdisk on extended memory machine. FTeDOS can
probably use any RAMDISK program you use. John
Picken's RM.COM and RM66/67.COM (free) and
PSI ramdisks are some.
eg. RAMD D8: (must RENAME RD.COM to RAMD.COM)
CHVOL - change volume name of a disk. eg CHVOL D1:NEWNAME
CHTD - change time/date stamp of a file. eg. CHTD
FILE.EXT sets the t/d stamp to present t/d.
SCOPY - sector copy from one drive to another. Will
abort if there is a sector error. SCOPY isn't
used much, Disk Communicator is used instead
(DCOMM32.COM.)
eg. SCOPY D1: D2:
SCOPY D1: D2:FILENAME.SCP
SCOPY D2:FILENAME.SCP D3:
HDINIT and HDFMTPH - These are hard drive formatting
programs. FTeDOS supports up
to 16 meg hard drives.
BATCH FILES:
A text file can be made to do any FTeDOS commands or
run any external binary file. Just make the text
file with the correct syntax on each line.
STARTUP.BAT is searched for on the boot drive and
executed at boot time if found. You can run a batch
file from the command line by typing its name.
eg. KEY OFF
D1:RAMD.COM D8:
COPY D3:*.* D8:
CTHTDL
CAR
Above will turn off the keyboard buffer, then establish
a ramdisk on an extended memory machine, copy all files
in the root directory of D3: to D8:, turn on the CTHTDL
time/date line, and run the cartridge.

Happy new year, everyone! :)

I've opened the year with applying long-overdue supervideo mod to my trusty 130XE. The mod itself went well (woohoo!), yet I couldn't help but notice somewhat vacated area at the bottom-left of the motherboard (Rev.B). I'm pretty sure this mobo was vanilla. Does anyone know what Atari was up to? Just curious.

FWIW there are traces for: 3 transistors (Q4-6), 2 IC's (U21,35), ~20 resistors and such, and one ~1cm*1cm square thingy designated Y2 (a crystal?).

Wow... you've got a rare one there.

I think you'll find those spaces on the board were designed to
accommodate the XEM sound chip. A number of boards were produced with
this in mind, but as the story goes, the chip was never debugged. The
Tramiels being the Tramiels, they used the XEM boards in production
machines to avoid completely wasting the investment in prototype boards.

Or it could just be additional spaces for RAM in case the kind used was
unavailable and a smaller variety had to be used ;)

hi russg,
actually what we sell is spartados 3.3c it was contracted for, and
specifically written for pro bbs which we own.
we do have the raw source code, that when we compile it will compile in
all three 3.3 modes, a, b, and finally c.
if you have something in mind for any of these version, please let me
know. i am open to any suggestions,
thanks,
lance

Lots of mother boards were set up such that they could be made either for
the American or European standards. The only differences were the different
crystals and glue chips to get the right frequencies and timing.

When did this happen? I always thought that you ran a SpartaDOS batch file by preceding it with a minus and foregoing the extension, e.g. in order to run the batch file "HELLO.BAT" you would type "-HELLO" (of course it has been a while, and I normally use MyDOS because I can mix in ATARI DOS and single density 810 drives into my floppy mix).

You'll probably need to get a PAL version ANTIC chip.

I've done PAL on an NTSC Commodore monitor. It works well - all I need
to do is adjust the Vhold.

: CES DEMO 1985 is the best demo i have come across for the Atari 8-bit
: systems.

You haven't seen many, have you? Joyride is a nice two-disk-long
demo with lots of parts, awesome music, and very cool effects
(hardware and software)

: It shows a shaded robot marching on a 3D-like walkway and a 3D
: shaded spaceships with smooth scrolling starfield in the background.

: Another one is a rotating Atari logo (with flying colors) and then flying
: swan fly by. Of course, the Bouncing balls is a classic for the Ataris.

: I think this CES demo uses the GTIA graphics (graphic 9) capability.

Yes, the robot and space ship ones are GR.9 mode.

The rotating Fuji is 160x192 (GR.15) mode with well-design DLIs to
adjust the color palette down the screen.

(The spinning "ATARI" and "130XE" logos are GR.8 of course, and the
swan is a set of PMGs)

How many users here have a 512k rambo? or a 320k XL?

I have about 4 XL here that I upgraded to 512k, the upgrade was posted on BBS's years ago and V.1 didnt work but the author released an update that worked perfect. While browsing the Atari upgrade site I cound not find this upgrade doc.. Im going to hunt threw my disk's for it (1000+) not an easy task.

Also anyone here with a 320k XL? is so do you have the docs for the mod? I have a few stocked XL here just waiting an upgrade. I picked up an XL a few years ago that had a 320k upgrade but for some reason stoped working and I must fix it.

1400 rarely, 1450s even more rarely. I do have an official disk labeled
something like "DOS II for the 815 Drive" and there are 815 in existance,
but they are very rare.

What some of the rares consist; advanced prototypes from the Atari
warehouse, preliminary production tests, models sent to developers, that
kind of stuff.

When Atari had its warehouse sale, I think I saw a total of three 1450XL
prototypes and a few other odd pieces like an 600 XL looking thing labeled
"Patty". The is the extent and the nature of it. Bob Brodie, an Atari
employee at the time, grabbed one of the 1450s for a keeper and loaned it to
Bob Wooley for a SLCC meeting.

Yeah there more compatible with the XE computer than just a stocked rambo,
what 256k upgrades are in your system? are they ICD's Rambo or another type.
after doing the mode you no longer have to wait 10 seconds to reboot. The
ICD 256k and the CB pd upgrade is what you need for the next step to 512k,
the Wiztronics 256k has a problem.

I've also seen a few (and yes RARE) 1400xl and 1450xld. last time was in
1992 at an atari show in toronto. Rumour (and a very unlikely since the
source was a known troublemaker) there was a number of 815's in the
toronto area. However I haven't personally seen one there are a few
lurking about the US. Best electronics has a few in their collection
(but not for sale that I've ever seen).

Seems most likely, now that you mentioned it. The parts count looks
a *little* excessive (isn't there some overlap between NTSC/PAL
components?), but that's bad-ol' Atari I suppose 8). Thanks for
clearing that up.

Definitely ;). But alas, Cortese-san's seems more likely, as the
2 missing IC's are of smaller and thinner variety (video buffer?)...
too small for a full-fledged new sound chip, I'd say.

Could you elaborate a bit on the XEM sound chip BTW? It's a news
to me.

From: Dan Vernon <dan@bitsofthepast.com>
Message-ID: <a1756qvug1@nntp9.atl.mindspring.net>
Source record: 32072

I've done a few simple mods in the past to my 1200XL (Supervideo for example), and now I've started on the wild and Woolley PBI upgrade. I've gotten somewhere around halfway through and everything works great... I have an XE 16 OS and internal basic rev C.

I'm not sure what to do when he says to solder pin 2 of HC08 to +5v, and then again later on when he lists the connection points for the 50-pin flat cable -- several are to gnd. Where on the 1200XL board is a good spot for +5v and gnd? My first thought was to use my mutimeter to find the closest +5v pad and use it, but I'm not sure if there are problems with this approach. I know that the wide strip around the board is ground, but its a little far away sometimes for convenience. Any hardware hackers out there have any advice? Anybody else out there completed this mod successfully?

Thanks!
-Dan

102. New tool: WriteAtr - read/write ATR-images from/to floppy on your PC

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-05 15:30:03 UTC
From: usenet-20020105@hias.horus.com
Message-ID: <slrna3e6oo.11p.usenet-20020105@camel.hias.horus.com>
Source record: 32073

Hi!

I have uploaded a new tool to my homepage:

The basic purpose of WriteAtr is to dump a double density (180k)
ATR-image to a 5.25" floppy disk in your PC, so that you can then put it
in your Atari floppy drive and boot off it.

WriteAtr also supports the other direction: put a double density Atari
floppy disk in your 5.25" PC disk drive and let WriteAtr convert it into
an ATR-image.

However, there are several limitations to WriteAtr:

- First of all: double density.

(Note: double density means 720 sectors/256 bytes per sector disks)
Since standard PC floppy controllers cannot access 128 bytes per
sector Atari disks (eg single density/90k, enhanced density/130k),
you need a true double density capable floppy drive on your Atari
(for example a 1050 equipped with an US-Doubler/Happy/Speedy/Turbo
modification).

The most important restriction to WriteAtr is, that it cannot be
used with single/enhanced density ATRs and floppys, only with double
density.

- WriteAtr can only be used in plain DOS.

Since WriteAtr has to reprogram the floppy controller, and therefore
needs direct access to the hardware, it will _not_ run inside a
Windows DOS-box!

Now that you have read so far, I will reward you with the URL :-)

http://www.horus.com/~hias/atari/writeatr-09beta.zip

Please note that WriteAtr is still beta! A detailed instruction on how
to use WriteAtr is included in the zip-file (writeatr.doc).

It would be great if you could send me some feedback if WriteAtr works
for you (indeed, even more interesting are the cases where WriteAtr does
not work for you, so that I can fix it :)

so long & thanks for every response,

Hias

It has been a long time since I looked at the schematic, but I think the problem was in the crystals available to derive the frequencies. The 3.79 mHz crystal used in the American version is a pretty straight forward design that feeds into the GTIA chip where all the timing signals for everything from the system clock to the video sync signals are derived. Actually the timing is just a bit off, supposed to be 60 Hz sync for VBI, actually comes out to 59.something.

I can't remember the crystal used in the European models, maybe someone with one can chime in. The extra parts were get derive their 50 Hz VBI and sync signals while still having a system clock that was close to the US market computers.

Hi Hias!
Good to hear from you!
I've always used AtariDsk - great program.

Now I wonder why WriteAtr should not work in a DOS-Box, since AtariDsk does?
(I didn't try yet)
And why didn't you enhance AtariDsk instead creating a new program ... ?

Menus are nicer than command-driven programs ;-)

regards
rudi

I use a monitor-to-scart-cable (using the fbas-signal I think).
Works nice for my NTSC-Atari800 (and for my PAL-800XL).
I'm sure it would also work on a multisync-monitor.

But my TV is multinorm and can handle NTSC, otherwise it's black&white (but fine).

> little far away sometimes for convenience. Any hardware hackers out there
> have any advice? Anybody else out there completed this mod successfully?

The multimeter approach is not highly desirable because there may be components in between whatever point you're measuring and +5 which due to circumstances, aren't offering significant resistance. This applies when testing with the board powered as well.

On TTL integrated circuits, +5 is <usually> the upper right pin and ground the lower left; this is looking down on the top of the chip with the notch pointing away from you. Naturally, this isn't always the case, I'd suggest downloading a datasheet or two.

For the HC08, if you already have connections to the ic's +5 and ground (pins 14 and 7, respectively), you can certainly use those.

For the PBI, ground connections can be to the ground plane as you've observed. However, it might be easier to find the PBI pinout and hook up to existing ground/+5 connections; it is very likely several such connections exist. From online docs, pins 1, 10, 19, 29, 30, 32, 42, 45 and 50 are ground. Only 600XL's appear to supply +5 on a couple pins, so you might have to pick up +5 elsewhere.

Generally speaking, when hooking stuff to the PBI, keep leads short- this is a high impedance interface with lots of bus lines running in parallel, which contributes to making it very susceptable to interference.

I believe NTSC should be 59.94 (1000*60/1001). I think it is in NTSC
specs.

> I can't remember the crystal used in the European models, maybe someone with
> one can chime in. The extra parts were get derive their 50 Hz VBI and sync

> computers.

The 50 Hz VBI is not derived by 'external circuitry' but by PAL Antic
chip. Extra parts probably only synchronize the two crystals??? I've got
schematics on my page, you can check.

The other crystal is for PAL color burst C016801.

List of used crystals (from my hardware pages):
CO15510 3,546894 PAL base clock (XL)
CO61090 3,579545 NTSC base clock (XL)
CO70034 14,187576 PAL base clock (divide by 4 or 8) (XE)
CO70032 14,31818 NTSC base clock (divide by 4 or 8) (XE)
CO70024 probably same as above

CO16801 4,433618 PAL tv signal clock (PAL color burst)

I have 800 XL schematics, which also mention what is different between
PAL x NTSC models.

It's (PAL over NTSC):
1) Different GTIA & ANTIC
2) Different main crystal
3) Added second crystal for color burst and something around that
(schematics mention 7474 and few discretes)
4) Different RF modulator

It results in (PAL over NTSC):
1) Better picture (PAL is better, also no artifacting)
2) Different colors (PAL GTIA has one color missing)
3) Different sound (POKEY is dividing main freq, which is different)
4) Slower execution (slower clock, less frequent VBIs)

5) Bigger screen and more time in interrupts.

> format, I mean...)

Sure, should be no problem!

The only slight problem is, that I don't have a XF551 at home, and thus
it's a bit hard to test.

Another thing I don't quite recall is the sector arrangement used by the
XF551. IIRC sectors 1-720 were located on side 1 in the tracks 0-39,
and sectors 721-1440 were locaded on side 2. The thing I don't know is
if the tracks were reversed on side 2 or not... (i.e. if you first read
sector 720, and then read sector 721, does the XF551 do a full seek from
track 39 back to track 0 and switch to side 2, or does it stay on track
39 and simply switches to side 2?)

If someone could shed a bit light onto this problem, I could implement
double-side support and then upload an (untested) version to my
homepage.

so long,

Hias

Thanx a lot, I'm glad to hear that!

> Now I wonder why WriteAtr should not work in a DOS-Box, since AtariDsk does?
> (I didn't try yet)

Hmmm... strange. I have to admit I've only used AtariDsk (and WriteAtr)
in plain MSDOS-Mode. The last time I tried to use AtariDsk from a
dos-shell within Windows was several years ago (IIRC with Win95) and it
didn't work for me.
But if AtariDsk worked for you, WriteAtr should work, too, because it
shares the disk-access code with AtariDsk. Nevertheless, I'll check it
again.

> And why didn't you enhance AtariDsk instead creating a new program ... ?

Good idea (actually, I've already thought of that - see below).
Maybe, when I have some spare time again, I'll merge the code into a
single tool.

The main reason for the separate program was that WriteAtr started as a
very-quick-and-extremely-dirty hack approx. one year ago. During the
last days I dug it out again, cleaned up the code , added a lot of
sanity checks (and the code to create ATR-images), and finally decided
to release it.

> Menus are nicer than command-driven programs ;-)

Sure. But adding menus to WriteAtr (or integrating it into AtariDsk)
would have meant that I had to understand the code for the menu system
that I wrote 10 years ago - an awful nightmare :-)

so long,

Hias

Ebay is getting a little sparse on Atari stuff and there's some things I need. Although I can read 6502 assembler, I'm a little, no a lot, rusty on the instruction set and have nothing on the memory map (which is really the more important info anyway). Also, I'd like to get a hold of the MAC/65 toolkit and the SpartaDOS toolkit (x32g if it matters). So here's what I think I need:

Books like Mapping the Atari and/or DeReAtari.
The MAC/65 toolkit on ATR or disk.
The spartados toolkit with docs if there are any.

Can anyone tell me where I might get the books and if either or both toolkits are available anywhere and if they are still licensed? I downloaded an ATR for MAC/65 toolkit but it was blank. I also downloaded the spartados toolkit as an .arc. The DISKCOMM I had doesn't work (just get a few lines of header and the rest of the screen is junk), and I'm not even sure it would turn and .arc into a useable disk if I had a version that did work.

Any ideas?
Thanks,
John

Hiya, Lance.
Making 3.3x into a cart, like SpX, I think you're talking about.
I realize 3.3c is a cart, but not an ideal one, I guess.
You've got the person that can do things like that (Tom Hunt.)
Or rather that 3.3c comes on cart from Video 61, I think.
Beyond my abilities, sorry.
The whole history of Sparta/FTe updates and authors was discussed
several months back. I kinda got lost. A name that wasn't mentioned
in that discussion, that I recalled later, was Steve Carden. Apparently
there was some friction about it.
I don't think anyone has a good history of versions of Sparta on web.
I noticed one site where the person had modified Sparta for use
with PAL machines.
I've spent the last couple days catching up on FTe DOS (3.2f 3.2g).
I hadn't realized 3.2f had a Y2K correct TDLINE. Tom Hunt
made one that is on my site now, because I didn't realize there
already was one.

I've just found it in the FAQ:
Side 2 is written in reverse track order[1].

Be prepared for another beta version later this day!

Thanks for a quite interesting tidbit :). Yet my 130XE is pretty old
(bought it circa '85), so I guess this wouldn't be the case with mine.

I guess you're right; what still strikes me as odd is that the 800XL
mobo seems to have a similar facility in far fewer components (just a
small section in the video circuit, ~10 parts in total IIRC... and I'm
too lazy to open it up again just now *^_^*). Hmmmm...

Source record: 32095

I've never owned a 1200 XL, but there are quite a few folks who have raved about the keyboards. But then there is the downside - OS, no built-in basic, no PBI, arguably the worst video ever produced by Atari. Of course, there are hacks to fix these things, and plenty of "real estate" in that case. Has anyone ever seen a 1200XL using an 800XL Motherboard? Certainly would require case surgery, but probably the biggest question would be if the keyboard connectors are the same (plug and play :-)

Russ Gilbert

: I don't think anyone has a good history of versions of Sparta on web.

I only have the most important on my site.

: I noticed one site where the person had modified Sparta for use
: with PAL machines.

It was a patch (changing bytes using a sector-editor) for SD 3.2c/3.2d, published by ABBUC magazin (Germany). It seems to work with about any version of Sparta-Dos.

I also have other "non-official" versions listed, like the ones patched by John Picken. Those relocate a buffer to RAM under the o.s. Results in more free RAM. (Not compatible with BASIC-XE)

130. Uploaded WriteAtr V0.91 beta

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-06 20:22:48 UTC
From: usenet-20020106@hias.horus.com
Message-ID: <slrna3ha1m.12c.usenet-20020106@camel.hias.horus.com>
Source record: 32000

I've got several requests to support higher capacity disk drives, and
therefore decided to upload a new preliminary version of WriteAtr
(V0.91 beta) to my homepage.

The new version is designed to support the following formats:
- 360k DS/DD 5.25"
- 360k DS/DD 5.25", as used by the XF551 drive (reversed track order
on side 2)
- 720k DS/DD 3.5"
- 1.44M DS/HD 3.5"

Have a look at the documentation included in the ZIP-file for more
information.

Please note that I did not yet have the possibility to test the new
code with real Atari disk drives, since I do not own a XF551 and
currently don't have access to my 3.5" (HDI) drive. So, if possible,
test it yourself, and email/post your experiences! (So far, I
have only tested the code for 180k SS/DD 5.25" disks with my 1050 -
and it seems to work)

If you are having troubles with V0.91 beta, please use the older
version V0.9 beta.

You can download both versions from my homepage:
http://www.horus.com/~hias/atari/

so long,

Hias

don't know why the CASINI stuff is there... I think its some kind of boiler-plate type loader code that the crackers put in. Probably doesn't make much difference.

The real key was to find all the incorrect portb sta's, which look like this:

```
A9 8F LDA #$8F
8D 01 D3 STA $D301
```

actually there are a few bits that store $8E also. In either case, to not trigger a bank switch in the XE, one must set bits 4 & 5 of port B to be compatible with a stock 800XL, so for the code above, the $8F should be $BF. There were something like 4 or 6 bits of code like this in the whole thing.

Regarding XF551 DS/DD disks...

Looks like you're reading the sectors in tracks (or some other kind of blocks), and the sectors within the block are in reverse order... (I'm refering to sectors 721-1440). Something like, instead of 721->729 they are written 729->721 or maybe instead of 721-738, 738->721 (more probably the latter). I'll email you some ATR images... (3 total)

Have you checked for a bad connection some where? My 576K looses about 256K every now and then and I have to make sure everything is seated and the solder connections are good.

138. Power supply question

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-07 07:38:40 UTC
From: bobbyshaw@aol.com
Message-ID: <20020107023840.11298.00000175@mb-fn.aol.com>
Source record: 32009

I am currently testing all my old Atari stuff for a near future sale (see link in sig line). I've looked at the FAQ for some power supply info, and have a question. The FAQ shows the following:

9 V AC 15.3 VA (1.7 A) Atari#CO14319 transformer:
400,800,822,850,1010,1200XL
9 V AC 31 VA (3.4 A) Atari#CO17945 transformer:
400,800,822,850,1010,1200XL,810,1020,1050,XF551

Now, it appears that my one CO17495 power supply doesn't work. I hooked one of my several CO14319's to my 1050 drive in order to test my software, and it's been working fine. I see that the 2 power supplies deliver different power amounts, and that the 1050 isn't listed on the devices for the CO14319.

Am I causing (or already caused) any damage to the power supply or floppy drive?

Thanks,
Robert Shaw

That would be the Amy chip. Its been a while so I remember very few details.
I think this was being developd by Alan Kay and they never could get it to
work very well without eating up all the resources. They outsourced the work
and it disappeared into vaporland.

(Alan Kay is the guy who devleoped WIMP at PARC/Xerox).

You mentioned U35 before. It probably was never used outside the Atari
research and development department. U35 was used when U34 was not CO25953
but a PAL16V8. For some reason the PAL16V8 needed a slightly different
(probably only shifted in time) HALT signal.

Its extremely unlikely anything is being damaged by the broken power supply. The different ratings refer to the rated output power of the transformer inside the power supply unit- functionally, the power supplies are identical. It is arguable that the higher rated unit is more suited for the computers, the lower for the floppy drives- but I think they're pretty much interchangable.

The old Atari supplies have a fuse in the unit that wears out over time. The transformer itself is probably just fine. One procedure we've used is to crack open the transformer case, replace the fuse, reassemble. I'd include the transformer in the lot with the understanding its disabled- its quite fixable and Atari stuff isn't so common that it should be thrown away...

Where can I download that for my Atari 800xl? never heard of it.

When was it written? I will be surprised if it was written in the mid- or early-90s.

The only problem is that I don't have a modem for it to get Joyride. I probably would need APE/Prosystem to save it on a 1050 floppy disk from a PC to appreciate the demo on my 800xl.

Any other GREAT demos for the 8-bit?

Yeah, I couldn't be able to type the Atari 400 too well, before deciding to get a better one, the Atari 800xl from Santa.

When I got that 800, I was surprised to find that my college roommate mentioned to me (back in 1983) about the Atari 1400xl (with built-in voice synthesizer) and the 1450XLD (with internal dual-disk drive, rare!!!!)

Mike

146. My GREATEST game titles

Newsgroup: comp.sys.atari.8bit

Message-ID: <B85F16F8.1CA9%design3d@2-scale.com>
Source record: 32017

Does anyone know of a good website or FTP site that might have all/most of the games for the Atari-8bit?

Activision, Synapse, Atari's, oh boy, lots of companies these days....

HERO, Keystone Kapers, Kaboom, FlipFlop, OilWells, Mr.Robot are my all time favorites, to name a few here. Beside PacMan, etc.

I love Mr. Robot because I can redesigned the donkey-kong-like futuristic structures, obstacles in the game, so colorful and challenging and different all the time.

My _LAST_ game I ever got for the Atari 8-bit is the SpinDizzy, back in 1987, because it is the last game I trade with my roommate before I graduated college. Spin Dizzy is a variant of Marble Madness but it makes you dizzy because of maze complexity. Much better than the Mission Impossibility.

I would LOVE to know:

what are game titles AFTER 1987?

What would be the LAST game titles ever programmed (or sold) and what year?

I would be surprise if there are more game titles during the mid-1990's.

Mike

I can tell you that the keyboard connectors are not the same. The
800XL connector is some kind of mylar connector, while the 1200XL has
a pin header type connector.

So you would have to do some soldering to get the 800XL keyboard into
a 1200XL I guess.

The 1200XL keyboard has two chips, which are located on the main board of
most
other Ataris. I once wired a 1200XL keyboard onto a 400, but I no longer
have
the 400 or any written notes about how I did it.

Source record: 32024

Well,
I had the My-Ide for some weeks - until I sold it.
It worked merely with My-DOS (My-IDe = MyDOS!) not with sparta or bewe dos.
It is limited to 8 drives or partitions, if you have the S.O.S. (selfmade-OS) all of these 8 drives can be booted, otherwise booting is limited to drive 1. Disadvantages:

- uses only 8bit/half of the parallel bus, thus half of your harddisk is wasted/unused (does not matter if you have a gigabyte harddrive, I know...)
- is slower than most other hard drive interfaces (black box, msc, etc.)
- works only under DOS 2 / MyDOS not sparta or other non-Dos-2
- is limited to 8 drives/partitions or even less if you still have and use real drives/ramdisks

Advantages:

- very very cheap !!! cheapest avaiable harddisk interface, I think;
- no copyright (also no warranty) and thus no flamewars with dealers, vendors or copyrightholders (especially after the dealers have disappeared); it is free usable for everyone...
- versions for 400/800 and XL/Xe computers avaiable...
- can use 16MB partitions and subdirs under MyDOS...

Thats all so far. Hope it was not to negative. Greetings, Andreas.

Well,
both Sheol and Timekeeper are saved in a form, they will boot
automatically and load/copy all nescesarry stuff to Ramdisk. But here is
the problem: They merely support polish ramdisks, known as Toms 256k,
320k, 576k and 1024k. No-one outside eastern europe has such ramdisks,
meaning these two demos (and a few others, like Cogito from AIDS) will
not run on our western ataris. Sad but true, I have a so-called
compyshop Megaram-2 with 256k (thus a total of 320k RAM), but both demos
do not run on this RD. These demo guys should have been so nice, to
include a ramdisk setup-menu, like some other fellows did. Then everyone
would be able to enjoy these megademos. Ok, maybe someone is able to
patch these demos (the ramdisk / rambank bytes) or include a ramdisk
setup-menu, so they can be run on other computers / ramdisks also
?!?! -Andreas.

Well,
speaking of FSII, I have a delicate question: microsoft had to patch
their newest version of their flight Sim., so no-one had any longer the
chance to crash into sky-scrapers. Besides that they had to remove the
WTC towers (we all know why).

Now, in FSII there is a scenery disk New York (or is it already part of
the main game?) and as far as I know, you can fly around the Statue of
Liberty. Is it also possible to crash into a high building and
especially does the New York scenery of FSII include the skyline of New
york ?!?

Well, I won`t try to crash into something, but I do hope Bruce artwick
was smart enough not to include such a possibility into FSII...
-Andreas.

[snip]

Hello Michael,
maybe we can include some info about Atari programs that a) support xtra-ram (but still run on 48k or 64k machines) and b) absolutely need xtra-ram (and thus will not run on a 48k or 64k machine). I do not know where to include this info into your FAQ, but if you are interested, I can create a list with lots of programs I know, belonging to subject a or b. Think this could be of interest especially for those Atarians that have xtra-ram avaiable (or those who do not know what to use the xtra-ram for...) greetings, Andreas.

Well,
what most Atarians do not know, is that this is already the cracked or patched file version of the full XANTH CES 1985 demo. the full version was made especially for an Atari 130XE and used its Ramdisk (but not its Freddy chip, like Video Blitz does, argg!!). Thus you had a file of 580 sectors in length, including a) the walking robot, b) the fuji boink, c) the Swan, d) the spaceship and e) a scroller - all in one demo. since this full version was only visible on a 128k machine someone has patched it and created 3 separate file demos, nowadays known as the SWAN demo, the Robot/spaceship demo and the Fuji boink demo. But originally it was just one demo, thats why the swan demo part displays "130XE power" !! -Andreas.

Well,
the XF can be upgraded to 3,5". You can then also use 720k - but I guess it still uses the reverse track order (not compatible with the HDI). But anyways, how many HDI`s are out there (approx. 50 items) compared to the thousands of XF drives ?!?
greets, Andreas.

Well,
you missed the goldrush, er, software-rush from Poland. They brought us
software from 1989-1997; even nowadays there are some cool programmers
left, so if we are lucky, we are going to see DOOM XL, Mr. Proper,
International Karate Plus and other titles soon. -Andreas.

That's correct - I just verified it with the ATRs I got from you.

I hope I can implement a fix during this week - if I have the time
(today's my first day back at my job, after two weeks of holidays...)

so long,

Hias

Hi!
On Mon, 07 Jan 2002 22:10:39 +0100, Andreas Magenheimer wrote:

> Well, the XF can be upgraded to 3,5". You can then also use 720k - but
> I guess it still uses the reverse track order (not compatible with the
> HDI).

Sounds reasonable.

When the 360k XF551 mode works, supporting this format should be no
problem.

I assume, the XF551 stores 80 tracks of 18 sectors on each side of the
3.5" disk - correct?

> But anyways, how many HDI`s are out there (approx. 50 items) compared
> to the thousands of XF drives ?!?

Could well be :)

BTW: I've designed the core disk acess layer of WriteAtr to be as
flexible as possible. So supporting new formats is not a big problem.

The only problem I've got is that I don't know much about the various
sector to sector/track/head mappings used by the different drives. Since
I only own a 1050 and a HDI, it's quite difficult to reverse-engineer
and to test.

If someone provides me with information concerning the mapping of a
certain drive, I'd be glad to support it!

so long,

Hias

Too much to list...

: What would be the LAST game titles ever programmed (or sold) and what year?

What do you mean with that? You are talking like there are no new games in
development anymore. What about "Mr Proper". What about "Doom"?

: I would be surprise if there are more game titles during the mid-1990's.

Well, be suprised:

-Klatwa
-Miecze Valdgira 1
-Miecze Valdgira 2
-Nero
-Geometria
-Change
-Tusker
-Frank and Mark
-Jurassic Park I
-Extirpator (90's?)
-Jurassic Park II
-Dynakillers
-Geografia Polski
-Global War
-Hawk Moon
-The Jet Action
-Hans Kloss
-Gabi
-Kuadryk
-Muff
-Lemmings
-Brundles
-Czaszki Electra
-Spy Hunter
-Tekblast

-Fire Stone
-Rockman
-Defensor
-Around the Planet
-Streets
-Zbir
-Rycerz
-Spymaster
-Fred
-Shit
-Johnny the Ghost
-Scaremonger
-Oblitroid
-Humanoid
-Battle Ships
-Magia Krysztaly
-Krucjata
-Microx
-Thinker
-Deimos
-Whoops
-Whoops II
-Dagobar
-Thinx
-Syn Boga Wiatru
-Android
-T-34, the Battle
-Upior
-The Convicts
-Outris
-Knock
-Robal
-Duch
-Gallahad
-Barbarian
-Saper
-Aurum

Hmm, I think I'll stop now, however I've got many more laying around, like
Monstrum, Klax, the Warsaw Tetris, Tommies, Midnight,... no copies... all
ORIGINAL disks... o.k. I shut up now...

(p.s. I didn't even start listing utilities like music-composers, painters,
MOD-trackers and players etc...)

Fascinating! I've always wondered why Atari hadn't developed the 8-bit
line further - *SO* ahead in '79, then basically stood still. It's
good to see that there were some efforts to push the baby forward :).

Mmmmm, so 130XE Rev.B has a facility to accomodate variations in the
PAL video circuitry which was not going to be used in production
anyway, correct 8)?

I guess Kilpatrick-san was not far-off... only it was not the new
sound chip. Far less interesting, yet still fun :).

172. Atari Printer (P:) emulation on the PC

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-08 00:56:34 UTC
From: John McCulloch <mcculloch@accesstoledo.com>
Message-ID: <6tr_7.389282$C8.28333345@bin4.nnrp.aus1.giganews.com>
Source record: 32042

Anyone know of a printer emulation on the PC that will work with WinXP and a SIO2PC cable like APE does? APE works very well for disk access, but the WinXP version I've been beta testing doesn't work so well for printing. I still need a way to print from the Atari and I don't have a dedicated printer or an interface to my 800XL to allow that.

I know this might be asking a lot but both Atari810 and APE for XP work great on WinXP for disk access. Atari810 doesn't do printer emulation at all, and APE for XP does try to support it, but it certainly falls short. I've sent my experience with printer emulation to Steven, but no reply yet. At first I thought the problem might be that the printer I was printing to was on a print server on my network, but the same problem exists in printing to a file on the PC. I've tried all kinds of time out variations and it still doesn't work well.

Any ideas?

Thanks,
John

Gee whiz, that's too bad! ;-) (said the MyDos user of 17 or so years.)

> - uses only 8bit/half of the parallel bus, thus half of your harddisk is wasted/unused...<
In essence like the upgrade in Atari Classics?
i.e. 256 byte sectors?

Is this likely to work with a ZIP drive? That would take care of the 8 drive limit.

Decided last night to build one of these with an internal notebook drive, so your comments are timely for me -- Thanks!

Larry

I don't think so... the orginal BBSB was a 40k bank-switching cart if I remember correctly... which doesn't give too much room to play with. Who knows... perhaps it could be done if screens were loaded dynamically in from disk or something, but this would be major surgery and understanding that code is hard going.

All other versions of BBSB that I've come across are PAL only. So far, I'm not sure if they will fail to play screen 6 also. You need a real Atari to employ the cheats since the emulators don't support holding down two keys at a time in the same way the real Ataris did. I've ordered a PAL antic from B&C and will pop it in the trusty 1200XL as soon as it arrives to try out those PAL versions.

Well,
both Sheol and Timekeeper are saved in a form, they will boot
automatically and load/copy all nescesarry stuff to Ramdisk. But here is
the problem: They merely support polish ramdisks, known as Toms 256k,
320k, 576k and 1024k. No-one outside eastern europe has such ramdisks,
meaning these two demos (and a few others, like Cogito from AIDS) will
not run on our western ataris. Sad but true, I have a so-called
compyshop Megaram-2 with 256k (thus a total of 320k RAM), but both demos
do not run on this RD. These demo guys should have been so nice, to
include a ramdisk setup-menu, like some other fellows did. Then everyone
would be able to enjoy these megademos. Ok, maybe someone is able to
patch these demos (the ramdisk / rambank bytes) or include a ramdisk
setup-menu, so they can be run on other computers / ramdisks also
?!?! -Andreas.

Well,
I did not say these demos won`t work on an NTSC system. They just have problems with most ramdisks. For instance I have a 320k XL computer (equipped with Compyshop Megaram 2 = 64k RAM plus 256k extra Ram; Rambanks: 23,27,2A,2F, 63,67,6A,6F, A3,A7,AA,AF, E3,E7,EA,EF;) and still they do not run on this machine. I also have 3 XE`s with 128k and 1 XEGS with 64k but thats not enogh RAM I know.

Most polish 320k demos do not run at all on this XL machine or they need to be setup via a ramdisk setup menu (like we find it in Khai-ET by AIDS or Impossible but Real by AIDS, or X-Demo by MadTeam and a few others). Unfortunately Sheol and Timekeeper do not have such a ramdisk setup menu... -Andreas.

P.S.: Compyshop ramdisks are the most common here in Germany, if not in whole Europe...

Well,
yes I still have this full version of the XANZH demo. I found it on the
Pooldisk Too by Bo and Ernest schreurs (somewhere in the subdir of an US
users library...). if interested I can send you a copy. but remember: it
has 580 sectors in lenght (plus DOS/DUP plus Ramdisdriver) and merely
works on a 128k machine... -Andreas.

P.S.: The full version of the XANTH demo was programmed in 1985, only
the patched XL binaries came out years later (and the Amiga Boink never
was a part of the XANTH CES Demo)...

Well,
I do not know the harddisk upgrade of Atari Classics, but yes the My-Ide
is limited to 256 bytes sectors. Besides that, you can also use 128
bytes sectors (and waste a lot more harddisk space).
At the moment I do not know if My-Ide will work with a ZIP, JAZZ or
LS-120 drive. You have to find out yourself or ask Sijmen Schouten.
greetings, Andreas.

P.S.: Not too bad for me: I like MyDOS and don`t like Sparta...

Questions:

What is (or are) the ** LAST ** game(s) ever written or sold in the commercial sector and also in public domain in the USA?

I will be surprise if there are MORE after 1995 (ie. Joyride demos). I wonder if there are more games out there during the 90's for the 800xl/130XE.

I think the last ROM cartridge for 8-bit Atari's is probably on around 1987, right?

My last software SPIN DIZZY dated "Copyrighted 1987" is my latest game titles so far.

I am pretty sure there were more over in U.K. or in Germany during the mid-1980s. not sure of 1990s.

186. fte 3.2 doc and a new file viewer

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-08 15:48:12 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3c3b14ba$0$37103$1dc6e903@news.corecomm.net>
Source record: 32106

I've put what I hope is final FTeDOS 3.2 reference on my site.
Also, there's a new file viewer for Sparta/FteDOS.
http://www.en.com/users/russg
Here's the doc from the file viewer:
****
1/9/02
A File Viewer
Russ Gilbert
This file viewer is because the COPY FILE.EXT E: doesn't
work with FTeDOS X32G. 3.2g does this to prevent
overwriting a file, if the device/file will open 3.2g
reports 'file exists'. VIEW7 opens for read, it won't
overwrite a file. It is for Sparta/FTeDOS only because it is
command line. eg. VIEW STARTUP.BAT or VIEW D3:FILE.EXT. It
has an advantage over the COPY to E: because it doesn't do
the control characters like clear screen, beep, etc. It
just prints those characters. It also has the advantage
over TYPE of viewing any file, binary, ASCII, ATASCII. It
doesn't translate ASCII files. Like the COPY to E: command,
you have to use CNTRL-1 to stop the scrolling. Unlike the
COPY command, VIEW7 fits on page 6, so it doesn't overwrite
whatever you may be working on. Don't enter a filespec
longer than one line, it will crash the program. Also, a
silly filespec like C:FILE.EXT will try to open the cassette
(or K:, S: etc.). VIEW7 is just for me to keep track of
which version. Of course you can rename it.

Well,
all of these demos come from eastern europe, Poland. They have great +
stunning 3D effects and cool fx, where everyone thought that they would
not only be impossible on the little atari, but one would need a giga Pc
with a mega grafic card and 3d accelerator. Now with these (and other)
demos from Poland everyone can see the real power of the little
A8... -Andreas.

P.S.: Download them at atari area (Poland) or look for some screenshots
at Satantronics homepage (Slovakia);

Hi,

> It is limited to 8 drives or partitions, if you have
>the S.O.S. (selfmade-OS)....

What's "SOS", where is it available - I've never come across it?

>....uses only 8bit/half of the parallel bus, thus half
>of your harddisk is wasted/unused (does not matter if
>you have a gigabyte harddrive....

From a hardware point of view this is patently untrue. Presumably MyIDE is operating the drive in 8-bit mode by setting the appropriate signal on the IDE bus? This affects only the INTERFACE between the computer and the drive, IE the IDE bus and NOT the drive (besides, all IDE drives store data in sectors as 8-bit bytes anyway).

If you're losing half of the drives' capacity then this is clearly a problem with the software driving it, rather than one with the interface.

TTFN - Pete.

Re: fte 3.2 doc and a new file viewer

SpartaDOS will, indeed, let you copy a file to the E: device, but the command uses a different syntax. I believe that you place a comma between the two parameters, or use a greater-than sign, or something. I would experiment with "junk" file first. Try something like "COPY FILE.EXT,E:" or "COPY FILE.EXT,,E:" or "COPY FILE.EXT>E:" ... Hmm... it has been a while. I wish that I could remember....

My ATARI XF551 is a 5 and 1/4 drive.
As far as I know, it is a Mitsumi (?) drive with a short, inverted ribbon cable. There is a one page spec. sheet listed as an appendix in the back of my DOS 2.5 manual. I'll post it if you want it, but as far as I know it is a generic clone drive except for the ATARI controller board in it. The 3.5" drive was an upgrade kit that others sold for it (like the US doubler chip to make a double density, single sided drive out of the ATARI density-and-a-half drives...).

Really!?

Where would I find 'Rainbow', an Atari 8bit emulator for the Mac?

As a starting point for me, I just ftp'ed a sample file FlipFlop.zip and it got unzipped as "flipflop.atr" on a PowerMac. Now I need an emulator for my Mac to be able to read it and run it.

Also is it possible to connect or find SIO-2-Mac connector?

I need a FAQ site that will answer those kind of questions and also giving me an idea of like:

How do I convert those .ATR file to an .EXE form - so that way I can transfer the .EXE (whatever it is called in Atari world) to a floppy disk on a 1050 drive??

Mike

Hi!
I have all my XL upgraded to either 512 or 1Meg 1088k, my XE are 320k to 576k. I have a lot of 8bit here cause it took 3 of them just to run my multi-line BBS years ago and plus I have many backup system in the event of a unit going bad. All my 8bits are Rambo compatible but always wanted to build the Compyshop ramdisk but could never find any info on it. The only demo I cant run on any of my machines is Hal94 side b, It wants that Compyshop ramdisk, however the demo dosnt crash it just reports ("Get a 256k ramdisk Lamer") that I thought was funny due to the fact it was running on a 512k XL, it also reports that same funny message on the 320-576k XE's ...
I would like to know more about Compyshop ramdisk. I went to ABBUC website a few years ago but its in German
and I only read english :(

The German people are Blessed!! to have such a BIG wonderfull Atari club!!
ABBUC Rules!
are you a member?

"Andreas Magenheimer" <magea000@mail.uni-mainz.de> wrote in message news:3C3AF48A.3780125B@mail.uni-mainz.de...
Well,
I did not say these demos won`t work on an NTSC system. They just have problems with most ramdisks. For instance I have a 320k XL computer (equipped with Compyshop Megaram 2 = 64k RAM plus 256k extra Ram; Rambanks: 23,27,2A,2F, 63,67,6A,6F, A3,A7,AA,AF, E3,E7,EA,EF;) and still they do not run on this machine. I also have 3 XE`s with 128k and 1 XEGS with 64k but thats not enogh RAM I know.

Most polish 320k demos do not run at all on this XL machine or they need to be setup via a ramdisk setup menu (like we find it in Khai-ET by AIDS or Impossible but Real by AIDS, or X-Demo by MadTeam and a few others). Unfortunately Sheol and Timekeeper do not have such a ramdisk setup menu... -Andreas.

P.S.: Compyshop ramdisks are the most common here in Germany, if not in whole Europe...

From: Christopher Lang <christopher.lang@plus.cablesurf.de>
Message-ID: <a1ft1brna1@goliath.news.is-europe.net>
Source record: 32112

Folks,
does anybody know where I can get documentation/ROM file for the 1050 Turbo that was sold in
the old days by Berhard Engl in Germany? I think it is a ROM for the 1050 as well as
some hardware docs. Does he still sell it? (Probably not ...) Are the files to burn the ROM
available somewhere on the net?
If possibly somebody is willing to sell his 1050 with the Turbo module built in....let me know.

thanks a lot!
cheers
Chris

Folks,
does anybody know where I can get documentation/ROM file for the 1050 Turbo that was sold in the old days by Berhard Engl in Germany? I think it is a ROM for the 1050 as well as some hardware docs. Does he still sell it? (Probably not ...) Are the files to burn the ROM available somewhere on the net?
If possibly somebody is willing to sell his 1050 with the Turbo module built in....let me know.

thanks a lot!
cheers
Chris

If you have a PAL Antic chip in your computer you will see
PLAZMA/BUMPMAPING/WORMHOLES/BOBS Pictures with thousands of colors 4096 of
them..
If your Atari is NTSC you need the PAL ANTIC chip or they will not work.

What kind of Computer you have?

.EXE and .ATR are not necessarilly interconvertible; sometimes a boot disk could be converted to an .EXE file and an .ATR image of the disk could get the same treatment.

Normally the disk or image would contain files, some of which might be executable files. These can be manipulated with the normal utilities so often discussed here: HiasSoft AtariDsk, SIO2PC, APE, null modem cable, 10502PC, ProSystem...

: theres not 1 demo I cant run,

All demo's written for the "Compyshop" 256 / 320Kb will not probably not run.

: all my 8bits have been upgraded with Antic pal
: chip.. Where did you hear that the polish demos will not run on Ntsc
: system?

Most of the time they do run, but some will give a (partially) scrambled
screen on NTSC. On NTSC, there is less time in the VBI, and NTSC has fewer
lines, which may cause troubles on overscanned displaylists.

: If a user has only 256k then you cant run a program that need atlease 320k

That's true.

: SIO2PC cable like APE does?

Just a solution...

Use MS-Dos and APE-Dos. Start-up your PC with DOS (use a bootflop when using XP), install the TCP/IP (NT-workgroup) drivers, install the network-client and make a network-path to redirect LPT to your PC where the printer is connected to.

I was browsing the Commodore sites, you know the other 8bit! and found this
http://www.zimmers.net/bbs/ all there BBS are free for Downloading and
there's about 100 of them, most offer color graphics to the caller and there
are screen shots and info on every system. BTW all the BIG IBM BBS's are
also FREEWARE or Sharware to!
I think Atari BBS's should do the same. The 3 good one's we have are OASI,
PRO, and Carrina. This is NOT GOOD.

Nope, Its rgb analog. Probley the BEST picture you can get is with the
AMIGA monitor, it has all the 8bit input jacks on the back. There's a
Color TTL upgrade published by Atari Classics a while back. But any
Commodore Monitor due fine.

210. MyIDE 800 OS Clu in USA!

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-09 02:17:10 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <0048cb09@fmlynet.org>
Source record: 32142

FamilyNet Newsgate

My fellow Atarians! (And especially those fond of the Atari 800)

I'm happy to say I received in the mail from my essemed compadre Mr.Atari from the Netherlands the completed (or at least well working beta) of the recently developed "MyIDE 800 Os Clu". :)

I'm sure many have seen his work on the internet and on his website talking about the MyIDE for the XL and XE and maybe even the status pages on the Atari 800 project.
What can I say? I love the Atari 800 above all other 8-bits. Got a 800XL with 256K Rambo, a XEGS, and so forth. But just find myself partial to the 400/800. :)

So I jokeningly mentioned to him I'd send him a NTSC Jaguar for a 800 version, and he took up the challenge. Months went by. He could have just bought a Jaguar in the box for pete's sake... but he was up to the challenge. I have to say, Mr.Atari is my kind of hobbyist! :)

So I get the package today. It has a hard drive all set up, and the specialized device to hook the Atari 800 directly to the IDe drive.

For the past .. what? Over half a year we have seen the progression of this at our chat site on Thurday nights and Sundays (http://stargate.cs.swau.edu/atari) ;) And we have heard how he had to rewrite the operating system, erase the cassette protocals, work with various graphics modes, insert XL code, write in the drivers for the hard drive, write in special functions.
And then there was the modication to the actual Atari 800 rom board, and just tons and tons of work. It has been fun to hear all about.

It arrived today, a hard drive, and a modified rom cart with a ribbon cable coming out of the back of it to connect to the hard drive. The drive was housed in a XF551 case I had recently found at the First Saturday Sidewalk Sale here in Dallas. After some cosmetic hurdles to overcome, I connected everything up, turned on the machine, and there it was, the intro screen showing the "MyIDE 800 Os Clu Copyright Mr Atari 2001" and then it loaded to a operating system (DOS) in about 3 seconds. :) I was amazed as the drive hummed quietly nearby in its new case. I was amazed as it showed off the immediately available partitions of 16 meg a piece. :)

I am pleased that we Atarians can be so innovative. We have come up with so many ways to make use of new technology. To graft newer machines to make the Ataris do still great things. From the ATR8000 to the Black Box. From 800XLDJ on the ST to the APE software on the PC... it's all good, and I have to say that the MyIDE is a awesome solution as well. :)

Where will it go from here? There is talk about someone here in the states selling the MyIDE here. Again, it would just be a matter of the user slapping a rom cart, hooking up the IDE hard drive, and somehow getting a power supply for it (XF551, PC power supply, etc). Simple installation.

Will it be sold? Who knows. But it can be done is what I believe Mr.Atari was trying to prove.

Keep those Atari's humming. With this I think we are off to a great start in 2002. Would love to know what we think of next. :)

(For pictures of the MyIDE, I will have them in the "Artcase of Antiquity" on the JYBOLAC website at....

http://www.geocities.com/doctor_clu/JYBOLAC.html

... in a few days. I'll be adding a lot of changes to there soon.)

Take care everyone!

Atari 800
The year is 2002
The Atari 400/800 is now 23 years old....
... and they still find new ways to rock! ;)

211. Re: fte 3.2 doc and a new file viewer

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-09 03:26:38 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3c3bb871$0$35623$1dc6e903@news.corecomm.net>
Source record: 32130

(I should quote, but dont'.)
Fox says COPY FILE.EXT E:* works ok.
Uhm. I'm not checking this, but that would work if it successfully
opens E: but 3.2g COPY receives a 'no such file' error.
I guess you checked it.Well, now who would'a ever thought of that?
Lemme see. 1st COPY opens the destination for read, if it doesn't
get an error, it reports 'file exists' and quits. Ok, I guess E:* results in
an error. 2nd it opens FILE.EXT for read and finally opens destination
for write, which must work.
I still prefer my VIEW program, as it doesn't do the beeps and clear screens
and backspace, clear line, etc.
Sparta has it's own I/O handlers, replaces the OS ones. It is strange
that E:* would result in an error for read, but not result in an error
for write. I'll try some BASIC stuff with 3.3a on emulator.
Regards,
russg

From: Kate Slaminko <krslam@netscape.net>
Message-ID: <3C3BCA54.D12E34F4@netscape.net>
Source record: 32134

Where can I find info on repairing various bits of equipment? I was
just spot checking some of my stash and found:
- 3 130XEs, an 800XL, a 600XL, and a 1200XL that don't boot - just get a
solid color screen (interestingly its a different color on each machine)

- an 800XL that otherwise works fine but only displays in b&w
- an 800 that doesn't recognize most keypresses. Tried disassembly &
cleaning of the k/b without improvement.
- Several 810 & 1050 drives that either yield boot errors or fail to
read/write/format.

No big deal since these are all spare machines, but any suggestions for
tinkering would be appreciated. Please reply directly to
krslam@netscape.net since I'm not a regular here. Thanks!
-Ron

When running a BBS you want as much ram as you can get, I have a 1088k XL
to run my BBS it has 8000+ sector ramdisk that hold all my ATASCII/ANSI
menus plus 150 pro cmd's and 10 overlays and then theres about 100 sectors
free! :)
also to run most of the NEW Mega-demos from Poland you need atlease 320k.
Maybe My next upgrade will be 4 megs.

Thanks. I don't know much, think schematics exist somewhere, but am posting
what I have.

> Did you notice there is a reference to a 1987 Byte issue in the Jan '84
> notes?

Yes. Byte had an article on the Atr8000 in the Dec *1983* issue. I think it
will be faster to
retype the rest of articles than fix all of the OCR errors. This is fixed and
uploaded. As far
as I can tell, I never got any issues in this year..have to search more.

Originally released on disc only. Maybe someone made a
homebrew-cartridge and then somebody else converted it then to ATR.

Sorry, but all computers that have a Freddy chip use it. It's needed to
access the RAM, main and extended.

What you're talking about is the CO25953. It's used every time you access
extended RAM (= everything that is above the lower 64kB).

What Video Blitz does use is separate ANTIC and CPU access.

Remember the small notice that told you to switch to 130XE mode if you had
more then x amount of RAM?

My XEGS runs Video Blitz without the need to switch most of it's 1MB out.

Nope!
This time PAL doesn't stand for the video standard but for a programmable
chip (programmable array logic???).
These PAL's are used so they don't have to use a lot of other chips to AND,
OR or invert signals.

The Atari 800 has a snap-down lid over the cartridge slots, which must
be closed to power up. How do you run the ribbon cable in there and
close the lid too?

>everything up, turned on the machine, and there it was, the intro screen

It would be nice if Lance (Pro), Alf (Oasis), and Dave (Carina/MOE)
would consider the benefits of publishing their source under one of the
better known and accepted copyrights/"Terms of Use" that so many other
packages have been successfully published under. If 90% of the IBM BBSes
have done it, then there might be something to it.

Hello there John, Donald, how's the atari going, keep the faith

anyhows, re:spartados... I never liked using this dos, as it reminded
me why I didn't buy a pc, that is why i still (sometimes) use my atari
8bit gear, which is still going after 16 years, I bought my first
atari (800xl dixons bundle) after getting my first job

I much prefer to use mydos, as it as the familiar look and feel of
atari dos 2x, and most, if not all the features of spartados plus the
fact that there exists versions of mydos that allow upto 48megs per
h/d partition, whereas sparta dos is ltd. to 16 megs

Additionally I seem to remeber that fte secured the rights to most of
icd's inventory incl. spartados, is this still the case

Also I seem to remeber that the original publishers of spartados where
also involved in the 810 and 1050 versions of super archiver and sup.
arch. 2, was this true

Lastly I seem to remember a disk drive upgrade years ago for the 810
called 'the chip' by spartan s/w, according to reports at the time, it
sounded more like the archiver 810, was 'the chip' and super archiver
one of the same thing

keeping the atari hummy

They/it makes sure the right bank is selected when (extended) RAM is
accessed.
It looks at the /Halt signal so see if ANTIC or the CPU has access to the
bus.
It looks at two pins of the PIA to make sure it swaps in the right bank of
memory.
It looks at two other pins of the PIA to determine if ANTIC or the CPU is
allowed to access the extended memory.
It looks at two adressbus signals to see which area of memory is selected.
(to make sure the extra bank is switched in at the right location, which is
between $4000 and $7FFF.)

(says COPY to E: will work with SpartaDOS, but need commas
> or something.)
Winston.
The comma delimiter looks like MyDOS syntax. Never tried it
with SpDOS.
Yes, COPY to E: works with SpDOS, but 3.3 or 3.2d.
Don't try it with SpDOSX, (I did) it copies file to D5: (SpX uses
letters for drives as well as Dn:).
We're talking specifically about 3.2g, which doesn't normally
work, gives a 'file exists' message when you try.
The COPY FILE.EXT,E: and other syntax I never heard of before.
COPY FILE.EXT E:* does work. I can't figure why. It has
to do with the way COPY works under 3.2g.

(a bunch of comments)
comment that spartados people also did 'archiver' and 'sup arch II'.
Uh. I think archiver and sup archiver were Bob Puff. Definitely
not the same people. Puff and ICD were competitors. Puff
made the Black Box and ICD the MIO. ICD didn't make an
archiver modification type thing, like CSS (Bob Puff's company).
Yes FTe bought all the rights to ICD 8-bit products. FTe also
bought Newell and other 8-bit companies stuff. A tremendous
investment. Very little income, I guess, resulted from these investments
and FTe is no longer available, disappeared.
This whole thread started because someone had a problem setting
up a ramdisk using MyDOS.
I'm not a MyDOS user, very much. 48 meg partitions for a version
of MyDOS? I dunno about that one. MyDOS 4.53 is the latest
one I'm aware of and I don't know what size partitions it supports.
I thought the 16 meg limit was more a OS thing than a DOS one.
I believe some OS modifications allow 512 byte sectors, larger
partitions (probably Bob Puff OS mods).
Bob Puff is sorta associated with MyDOS, think he helped write it
with Charles Marslett.

236. Re: Any 1200XL Ram Upgrades?

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-09 19:27:18 UTC
From: Dan Vernon <dan@bitsofthepast.com>
Message-ID: <a1i5cu$64p$1@slb7.atl.mindspring.net>
Source record: 31957

Well, I've never seen that one. Ummm.... could you please post a scan of the Claus Buchholz upgrade?

So far in my recent 1200XL hacking mania, I've come across two other upgrades:

one is a pdf entitled "XL to XE and More by Bill Dyke". I've uploaded it here:
http://www.bitsofthepast.com/atari/downloads/xltoxeandmore_memory_upgrade.pdf

another I found is a 1-meg SIMM upgrade by the one-and-only Woolley:
http://www.a8maestro.com/atari/info/memory/simm1meg.htm

I've not done either of these, and both look pretty good to me. The Dyke upgrade looks a bit easier, but having a 1 meg SIMM in my 1200 is pretty hard to resist.

One thing I'm worried about is achieving the closest compatibility with the 130XE banking, in which Antic and the CPU both can access the memory appropriately. I've read both upgrades several times, but am just not sure which one achieves the closest compatibility. In the Woolley upgrade, Bob talks a lot about bit 4 and 5 of PORTB, however the description of the upgrade doesn't make clear what is sacrificed in compatibility (at least for me to understand). I also can't figure out if I will lose internal basic, since Bob mentions that this must be sacrificed to get another banking bit. In the Dyke upgrade, Bill describes the upgrade using bits 2-5 for banking. This upgrade seems very close, if not 100% compatible with the XE. He does mention that accessing the banks is done by following "mostly the same produre thats been published for the 130XE" (note: I assume in Mapping, Rev 2).

Another thing I really don't want is an upgrade like the ICD Rambo 256 in which you have to leave the computer off for 10 seconds to clear the RAM. For me at least, this is too annoying to be worth the extra RAM.

I wonder if someone who has more technical expertise in memory upgrades and compatibility issues could respond here? Also has anyone successfully completed either of these upgrades? If so, please give us a mini review.

Thanks!
-Dan

I experience in the Mac world is that there is not a SIO2PC option... at least yet. The PC world, ST, and think even Amigas do. But Mac... well, just would take someone porting something like 800XLDJ (ST).

I have thought of running APE under SoftPC. Considering the APE software only requires a XT PC, well, I don't see why it would not work.

> There are a few of us!

Cool!! I can certainly see why.
Of course the 800XL and 130XE have definate advantages. But not for me.
:)

Speaking of advantages, know where I can find a 256K ram board for the
Atari 800 or a place to find instructions to make one? I have a few extra
Atari 800 ram boards to play with.

>> I'm happy to say I received in the mail from my essemed compadre Mr.Atari

> close the lid too?

Geez how did I do this? I would look, but if I did I would loose the message I am currently typing. (Doing this on a Atari 800 BTW .. through a BBS with newsgroup ability.)
Let's see, I unscrewed the metal cover under the lid, and then ran the ribbon cable between the lid and the metal plate.

I have the XF551 setup with a flip front so I can unplug the ribbon cable when I need to move it. Man Atari was clever making the XF551 power supply like they did. Didn't they?

>> everything up, turned on the machine, and there it was, the intro screen >>showing the "MyIDE 800 Os Clu Copyright Mr Atari 2001" and then it loaded to >> operating system (DOS) in about 3 seconds. :) I was amazed as the drive >> hummed quietly nearby in its new case. > DOS man. I might convert for a upgrade like this. If Mr. Atari wants
> to crank out another one, I will buy it!

> Thanks for the great news!

Hehehe... how did you know I ran MyDos? Well, never tried Sparta Dos 1.1 for the Atari 800 (What do they call the Atari 800 OS? The Axlon or something like that). Anyway, yeh, MyDos works fine with it.

As for Mr. Atari cranking out another one, well, never hurts to ask. He likes to trade and has a heck of a trading site. True to his name he is a Atari nut.. and has issues of Atari Force in Dutch (I believe) Now that's pretty cool.

I know what you mean about compatibility issues
The CB 256 works perfect with Sparta dos and Mydos in CPU mode, there's no Antic mode. And taking it to 512k is easy and Sparta dos works perfect with it but mydos can only use 256k of it. SDX see the ram as 320k. The good point is that after taking the 256k to 512k it fixes that 10 second wait from a shutdown.

Wouldn't SpartaDOS compatability just be a matter of writing a driver
for the MyIDE upgrade?

Patching the HATABS table and putting the I/O routines in a portion of
memory not clobbered by Sparta?

Long time atari user, but just started really learning about the
inards of the little machines.

A bugfix release for ATS (Atari Terminal Simulator) has been uploaded. This bug
caused random hangs on some systems when trying to connect.

ATS is a full ATASCII telnet client with upload/download capability in
Xmodem/Ymodem/Ymodem-Batch and F-Modem. ATS can also be used
as a serial terminal if you want to use a real modem.

ATS also can playback ATASCII 'break movies'. A screensaver version of
ATS is available as well. The download URL is:

I think Bob Puff was working on a new version of Mydos with 48 meg partition
size but never released it.
And my last chat with Bob Puff he said he's not doing software anymore :(

Hey Carmel, You dont know what Sparta can do! There are many thing that
dos can do that Mydos
can not. Mydos has no:

Batch file processor
Command line
Can move a file (MOVE)
Real time and date stamps for each file
127 files per sub-dir
Use drive 9 (D9:)

There are many many more but thats a few good ones, I also use Mydos all
the time and have Both dos's on my
8bit hard drives.

Commodore and IBM BBS are also access viva telnet
even Cnet bbs there big one is freeware. Software authors make money
when they put there programs in the domain. Check out the comp.sys.cbm
and you will see what the other 8bit is doing, but not only 8bits its 16/32
bits to.
I been Atari since 1977 but if I was new to the scene I would overlook Atari
completly,

254. Question on Atari 8-bit games with sound problems on emulators

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-10 07:59:40 UTC
From: Mike <mhill@cinci.rr.com>
Message-ID: <qohq3u02ihgvtc69emohi1i6hisi5039hg@4ax.com>
Source record: 31974

Hello,

I'm working on a update (slowly) to my old 8-bit emulator Pokey. Not sure if many of you remember it..... :)

Anyway I am working on sound emulation. And I believe I have pretty much 100% accurate sound, but I was hoping some of you could throw some game names at me that don't work correctly on all the current 8-bit emulators.

A good example I can give you. Berzerk. When you load the game you hear the digitized "Got the Humanoid, Got the intruder" with the current emulators. And when you hit the option key you hear them repeated while in the opening screen. But once you start playing the game you never hear the above phrases when you get shot, exit a level , etc. Now with my new sound emulation you get to hear it all.

So anyway I would appreciate any comments from you guys on as many games or programs as you know of that have any sound issues with the emulators out there. I want to test it as best I can before I release it into the wild.

I will also furnish the information and code for this emulation so other authors can incorporate it if they wish.

No target date yet for a release, but hopefully in a month or two.

Thanks for your time and your help!

Mike

Wow! Your depth of knowledge astounds me 8).

So I guess that's it... spare traces for alternate bank-switching
components had somehow remained on the Rev.B mobo.

Maybe not so exciting in the end, but it delights me anyway.
Many thanks, guys! (especially Nisselroy-san! ;)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I downloaded the ATR some months ago, but the game would lock up at
the crash landing site, on my 800. I remember thinking it must be
because I do not have the RAM configuration of an XL/XE.

For the Atari, there is the blackbox (check out http://www-users.rwth-aachen.de/mathy.van_nisselroy/blackbox.htm to see a picture) which can be updated with a Floppyboard (scroll down on the same page) which let's you add 4 standard PC disk drives. 5.25" and 3.5", maybe even 8", any mix. (but you can't use 1.2meg drives in 360kB mode). It comes with a utility to read, write and format PC disks. I use it all the time to copy files I got off the internet (I could try to convince the people here at the university to use 8 bit Atari computers, but.....) to my Atari and it's hard disk (connected to the BlackBox mentioned above). Sometimes I even prepare my mail on the Atari and copy it to PC disk so I can upload it here at the U.

CU Mathy van Nisselroy

PS the BlackBox also has my ZIPdrive and my CD ROM player connected to it. Plus my modem and my printer.

Shelton "Shelly" Merrill perhaps.
I ordered Diamond GOS from him and another utility that was anounced.
First he said I hadn't paid.
When I send him a photocopy of the money order with HIS autograph on it, he sent me Diamond GOS and Diamond Paint. I never ordered paint. I never have and probably never will like paint utilities. IIRC it was Diamond Publish I ordered. I never got it.
He also sent me back a rubber check for the rest of the money.

CU Mathy van Nisselroy

PS anybody know a good place to buy some tar. I can probably get some feathers at a local chicken farm/butcher.

ATOS needs Sparta DOS (because Tom Hunt is a Sparta guy) and a lot of
memory. Boss-X will run under MyDOS. I'm no sure how much memory it needs.

Howdy Hidehiko

> Wow! Your depth of knowledge astounds me 8).

I developed a 99.9% 130XE compatible 1MB (1024kB) upgrade using 30 pin SIMMs. (it only works in my XEGS at the moment) check out http://www.holyoak.com/atari/ and click on 400/800/XL/XE to see the schematic of my upgrade. Or check out http://www.myatari.net/back.htm and download the May 2001 issue (red cover, yellow text) for an article and photo of my upgraded XEGS.

So I had to learn about these signals.

Mine ofcourse. :-)
You can use my upgrade as a starting point. I don't know exactly where the
1200XL's MMU differs from the XL/XE MMU, but it might use different pins
(for the same job).

My 1MB XEGS still has separate ANTIC and CPU banking, (software control over) BASIC, OS RAM/ROM, SelfTest and Missile Command. No external switches, no funny addresses, nothing.

Hi Mathy,

I already exchanged the 1200XL MPU for an XE one in the PBI upgrade, so thats no issue. I seem to remember that you were still working out some bugs in the design... or perhaps that was just in an XEGS. Its been a while since I've checked out your plans.

Well, I want your upgrade! Any possibility of printed pcbs in the future?

The only things that mattered to me were, memory resident, high speed I/O,
and good ramdisk support.

I would use a 180k US Doubler drive as my primary storage vs. a 720k XF or
ATR8000 for both programming and BBS.

Ramdisks were prone to losing data after a crash when testing code.

I have three 800XLs. One has the CB 256k upgrade, and I can switch
it off for less than 10 seconds and back on and it works, but one of
my other 800XLs (64k) has to be shutoff for 20 seconds sometimes. Go
figure!

That was one great thing about the MIO - a severe system crash left your
ramdisks unscathed. Plus, prior to the advent of SDX, booting off the
ramdisk was the fastest method available. Lots of people had their MIOs
always on - I recall one guy whop rigged a backup power supply off a car
battery (I think).

Ah, the good old days...

I also use spdos most of the time, but keep MyDOS handy.
I use APE to boot with and MyDOS functions better with
APE than SpDOS with my setup. (I have a 11 foot long
1 chip cable, which is a little 'weak'.) Some write functions
work better with MyDOS. Sometimes SpX works when
neither SpDOS boot or MyDOS will work. SpX does
detect when read/write functions aren't going right and
slows down the I/O automatically.
I think MyDOS is 'quicker' than SpDOS for read/write
functions than FTeDOS 3.2g, as well as 3.2d, etc.

I have the sio2pc 1 chip version and with sparta dos I get ultr-speed even
from a mydos formated disk? strange huh. But if I boot with Mydos the io
speed is normal 19.2

: And my last chat with Bob Puff he said he's not doing software anymore :(

That's right.

: Hey Carmel, You dont know what Sparta can do! There are many thing that
: dos can do that Mydos
: can not.

However I'm a Sparta-Dos only user, I do have some comments on the next ones
:-)

: Mydos has no:
:
: Batch file processor

Yes it has, as external modules, written by Torsten Karworth from Germany

: Command line

Yes it has. Can't remember the name right now. Something like "BTC" or so.

: Can move a file (MOVE)

A real move... No. Just copy-and-delete

: Real time and date stamps for each file

Also true

: 127 files per sub-dir

I'm not sure about that!

: Use drive 9 (D9:)

IIRC, with a BlackBox you have acces to D9: if it is a redirected drive...

: There are many many more but thats a few good ones, I also use Mydos all
: the time and have Both dos's on my
: 8bit hard drives.

I deleted MyDos from my harddisk a long while ago.

AFAIR Mercenary should work just fine on a 400 an 800 (in fact I recall playing it on my 400), so I suspect there must be a problem with the ".ATR" you downloaded.

TTFN - Pete.

Do you mean 'AGAGD'? I never heard of that F-S Assembler. I do have a couple of versions of SynAssembler on my site.

I also noticed the author incorrectly claims the Atari AsmEd cart is unable to assemble to a disk file... Speaking along those lines, can anyone make SynAssembler put all your code in a single target file? Every time I change the ORG address, it closes the previous file and I must use DOS to copy them with append.

I have not waded thru the main 40K of code, so the cracker may have altered
the cart-banking stuff to use the OS RAM instead. Other than that, the RAM
space is the same as that on the 800.

Wasn't there work being done on using Compact Flash for a drive? IIRC, Compact
Flash is just some sort of specialized IDE interface. Now that would be cool,
having a cartridge with a CF slot in it! (But how would I use Action!...)

I have the Miner 2049er Cartridge and original instruction booklet. I am about to start auctioning my equipment off on Ebay starting with the books this weekend (with the cartridges following in a week or two) -- see the web page in my sig line. I'll be happy to go ahead and throw the Miner 2049er auction up this weekend also. I plan on starting the cartridges off at $1.00 with $1.00 shipping.

Let me know if you are interested, and I'll put it up, otherwise I'll wait and auction it in a couple of weeks with the rest of the cartridged.

Thanks,
Robert Shaw

IIRC there were two versions of Mercenary on different sides of the
floppy - one for Atari 400/800 and one for XL. The 400/800 version
was lower res, presumably because there wasn't enough RAM for a
higher resolution screen.

Could be that the ATR is the XL version .... though possibly its
just corrupt.

The 'Second City' was rubbish - one of the biggest disappointments
ever. All it did was turn your external display red and white and
change the underground mazes.

After the superb original (one of the best Atari8 games ever IMO) it
was a real let-down. I don't think I even bothered to play more than
an hour or two.

There was a followup called 'Damocles' which was ST/Amiga only,
then a Mercenary III (also not for 8bit).

Hi.

I remember now when I ordered my Black Box in 1991 Bob told me he was
working on a new version of Mydos
and then 2 years later when I placed another order I asked him about it and
he told me we was not doing software
anymore :(

There are still a lot of programs that will not run under sparta :(so I
still keep a small partition for it.
I use Sparta 90% of the time.

Yep

the 48k version is subtitled as the 'Fast version' though i did not notice
any significant speed differences between the two. I suppose it would be
noticable if there was a lot happening on the screen.

Source record: 31917

Howdy Lee, Ron, folks

> On a real Atari with an unpatched version of any MyDOS 4.50 and above,
> ramdisk won't work while you have BASIC rom on.

I never had problems using MyDOS and BASIC. But with my 1MB upgrade,
DUP.SYS and MEM.SAV didn't show up in the directory. Even though the free
sector count was the same compared to when BASIC is switched off.

BTW I've been wanting to ask this ever since Lee sent me the patch, have a
look at this (cut and pasted from Lee's patch file):

```
LDA $D301 ;0C0C AD 01 D3
ORA #$1C ;0C0F 09 1C
STA $31 ;0C11 85 31
ORA #$1C ;0C13 09 1C
AND $0BBA,Y ;0C15 39 BA 0B
STA $D301 ;0C18 8D 01 D3
```

That's what's in MyDOS before the patch.

I don't know much about assembler, but that second ORA #$1C doesn't change
anything, or does it?
(if that's true, this sure is a sign that somebody goofed up.)

Thanks Lee for fixing it. Now my 1MB XEGS (actually it's 1MB plus 64kB)
doesn't care if BASIC is on or off when it comes to the RAMdisk.

Howdy folks

> You need a cold start reboot switch or Omnimon and XL-Boss type OS which
> give access to 580 or similar RAM to cause a restart.

The UltraSpeedPlus OS buy CSS will also let you cold boot the system without switching it off.

Better though would be if we could fix this with some electronic components. Just in case there are no alternative OS's for your computer (like the XEGS) or if your favorit alternative OS doesn't have a cold boot option.

Howdy Dan, folks

> I already exchanged the 1200XL MPU for an XE one in the PBI upgrade, so
> thats no issue. I seem to remember that you were still working out some
> bugs in the design... or perhaps that was just in an XEGS. Its been a
while
> since I've checked out your plans.

I should mention here that the XEGS uses a slightly different MMU, so adding
a PBI to that could be a pain. Maybe we could piggy back them together.

It works 100% OK on the XEGS, it's the 800XE and 800XL I have problems with.
Maybe I should have studied Electronics instead of Mechanical engineering.
:-(

> Well, I want your upgrade! Any possibility of printed pcbs in the future?

Hopefully before I die. (I'm 35 and a halve next Wednesday and hope to live
for a long long time)

CU Mathy van Nisselroy

PS but you can look at the schematic (http://www.holyoak.com) and even look
at a picture (http://www.myatari.net the red issue with the yellow text on
the cover). :-))

Howdy Dan, folks

> oops... I actually exchanged it for an 800XL MPU... (the OS & BasicC were
> from the XE), so we do need to figure out the differences.

I know of three different MMU's:

a) 1200XL/1400XL
b) 600XL/800XL/XE
c) XEGS

So you shouldn't have any trouble.

Excuse me. Ever heard of an Interface PC -> Atari?
Ever heard that Atari 5.25 inch disks may be unreadable after several
years?
I am using still the REAL Atari for looking Demos. But I am not using my
XF551 - I am using the PC as a virtual Atari diskdrive. Ofcourse I do
not have this nice sound of a floppy drive ...
And I think there is a way of transfering the ATR "sectors" to a real
floppy drive.

With one exception: You are downloading your files with your real Atari
and then saving everything to a floppy.

Greetings, Sven.

301. A reminder for MyDOS users

I was chatting with a MyDOS user and remembered 'Fast Fingers'
from the Feb '84 Antic.
We have been talking here about SpartaDOS and batch files.
With Fast Fingers, you can make any commands of MyDOS
occur at bootup time. For instance, you could establish a ramdisk,
copy all files from D2: to D9: (if that was the ramdisk you made),
and do anything you can do from the keyboard as an autorun.sys.
It is really a neat program and I had not remembered it when
John McCullough was asking about making a ramdisk and copying
files to it.
Also, there is a BASIC.OFF and BASIC.ON programs that
could turn BASIC on and off.
'Fast Fingers', the program and the magazine article can be
found at www.atarimagazines.com (Kevin Savitz), Feb. '84.
Regards to MyDOS users.

Emulators do serve a function. I had to give up my Atari hardware a couple of years ago because I had some serious time and space issues. I found several emulators that sort-of did the job on a Pentium 100 that I was using at the time. Programs ran slowly, at best.

A year-and-a-half ago, I found that I could actually run an emulator at full speed when I bought a Pentium 3 800 machine. Imagine that! It takes an 800 Mhz Pentium to emulate a 1.77 Mhz 6502! Just one of the problems with emulation, I guess.

I also know where you're coming from in terms of using a PC as a peripheral to an Atari system. I was one of the first to review SIO2PC for Atari Classics Magazine. I made my own .ATRs using SIO2PC and APE for DOS. I used .ATRs to speed up the editing and duplicating of the Ol' Hackers Disk Newsletter when I was its editor.

And I can understand your frustration. It does take additional steps to download .ATRs and then transfer them to Atari floppies.

But there are programs that can take .ATRs and make .DCMs out of them. It also wouldn't take much time and effort for people who keep .ATRs on their Web sites to put .DCMs there, too.

Full ACK.

IMO the most important problem in the next 5-10 years will
by the old hardware (escpecially floppy drives and disks) starting
to die. I had to exchange the drive belt and motor of my first 1050
some 10 years ago, and also had to exchange several chips of my
800 XL: a dead RAM-chip, a POKEY and an ANTIC.

Maybe I'm a little paranoid, but I really don't like the fact that
most user-programmable chips (like EPROMs, GALs, and PALs, used by
several hardware extensions) are rated at an expected 10-years
lifetime (approximately). I almost don't dare to think about this
fact, since most of my equipment is older than 15 years by now....

Actually, I don't like using an emulator since that's a completely
different "feeling" compared to using a real Atari 8bit.

But using SIO2PC / APE with an Atari is a very good idea, IMHO.

> And I think there is a way of transfering the ATR "sectors" to a real
> floppy drive.

Currently I know of several possibilities:
- DiskFormer using an Atari only
- 1050-2-PC using a PC and a 1050
- WriteAtr (by me) using a PC only

so long,

Hias

The hardware repair/parts issue will become very important.

But think about how wonderful things have been until now! Atari 8-bit BBSs running 24/7/365 without interruption for ten years was not uncommon, for example.

There will be solutions, and I agree that SIO2PC will be a big part of that.

Take care.

Alan

>hardware a couple of years ago because I had some serious
>time and space issues....

Agreed, although I still have *ALL* of my original Atari equipment I don't currently have the space in which to set any of it up. :-(

Emulators do at least let me play some of my old favourite games in the meantime....they also help with software development (though in this case I'm talking about the Vectrex, saves burning endless numbers of ROMs).

> A year-and-a-half ago, I found that I could actually run

Not at all! Atari800Win runs at full speed on this Celeron 333 and can even reach 179% the speed of the real hardware if let loose....

> I also know where you're coming from in terms of using a

This is something I'm yet to investigate, I have an old P90 standing by waiting for the day I can find some space to set up the "old iron".

TTFN - Pete.

ATR files are very handy, I still use them as virtual disks via SIO2PC on my real atari. I prefer ATR files to say individual .com or .exe files because it's
a hassle to use them on the real atari, you have to add them to a disk image first then use them, well, my way of collecting ATR files means I save time pissing about with individual files, everytime I want a bash at something, demo or game, On my real Atari OR on a emulator.

Each to their own. :-)

I also keep a cdrom full of the individual *.com &.exe etc etc files too, JUST
in case I need them for some reason, but as yet, I havent touched it.

Regards
Aaron

I'd prefer this additional step, than having to deal with heaps of
individual
files. At least the whole disk is copied in one go, not file by file,
ugh... :-)

> But there are programs that can take .ATRs and make .DCMs out of them. It
> also wouldn't take much time and effort for people who keep .ATRs on their
> Web sites to put .DCMs there, too.

The way I see it, as the majority of people want the file to use on an
emulator,
why should Sites like mine 'Holmes' waste double the webspace doing
something that
is easily done by the small amount of users that need them in DCM?

When I download DCM files from a site, the first thing I do is convert it to
ATR,
am I being a prick? Not at all, Having everything in one format is great.
For me,
and thousands of atari users rediscovering the atari each day.

And if someone needed a ATR turned into a DCM, well, how hard is it to run
it
through a ATR2DCM program?

I certainly dont want to start any flame wars, as that would be stupid, all
I'm saying
is, no matter what format the disk image is stored in on a website, it's
damn easy
to convert it to whatever YOU prefer once you have it downloaded.

Yes I do download my stuff to my PC first, then move it to the Atari, why?
As I like
to keep a backup of everything on CDrom, and I dont have a cdwriter on my
atari 8
bit now do I?

I prefer ATR. nuff said :-)

I have often written images to real live diskette by way of
Diskformer. Usually I will do this with the serial connection from the
800 to the PC compatible, but sometimes I have downloaded the ATR
using BobTerm and then written the ATR to disk. All of this ATR use
occurs on my real Atari.

One disk image format (ATR) is as good as another (DCM) and it seems
like ATR is better in some ways.

By the way, your Holme's website is one of the greatest Atari
websites. I can't tell you how much fun I have had going there to pick
out something new and download it. I just tried to reach it now, but I
see it is not available right now. I hope you are back soon. Thanks
for the great service you provide to Atarians, Aaron!

Hello Dr. Clu (Greg)

This is really great news. I would have never thought it could be done.
Too bad your friend could not make alot of these devices for the
400/800, XE and XL. I know they would sell. Shoot, I would buy one
myself. It is really great to see these 8-bit machine still going. My
XE sits next to my Hades and I use it using 800XLDJ. I have my 400 and
two XL's in my closet along with my 8-bit stuff. Take care and good
luck with your special device. Keep us informed....

Hmmm...there's Galaxian.
Maybe you saw Phoenix for Coin-op, C64 or something else?

Hi Mathy,

At ftp://ftp.spudster.org/pub/Atari/CTH/_8bit_ToolKit/Atr2disk.arc you will find a utility that runs on a real A8 that can convert an ATR file to either a single density or enhanced density floppy. The docs say it's only for single density but it truly also works on enhanced density as well. Also, there is a substantial DCM section and a individual FILES section of games in the CTH Archive.

Sounds useful to me! Start a list, and I'll find a spot in the FAQ for it.

For the FAQ, I'd like to start a list of non-Atari-brand modems designed for
the 8-bit Atari = they connect directly to SIO without an interface.

Which makes/models do you have and/or know of?

Subject: Atari Stuff

I have a bunch of Atari stuff that I'm trying to find a home for. Do you know anyone who would be interested or is there a way to post the stuff to your newsgroup comp.sys.atari.8bit. I appreciate your help. Thanks.

Here'a a list of everything that I have.

Atari 800xl computer, Atari 1050 disk drive, GE DataRecorder model 3-5156 - appears to be all in great condition including the original boxes and instructions but the equipment hasn't been used in a long time

Atari power supply, 2 Atari joysticks, TV/computer switchbox - all appear in good shape but haven't been used in a long time

Antic Magazines - May 1986 thru April 1988 excluding December 1987, 23 issues, most in very good shape

Software: SynCalc, SynFile+, Family Finances, PaperClip, AtariWriter Plus, Stock Analysis, and Mortgage and Loan Analysis - all in their original boxes with instructions and diskettes

Games: Caverns of Mars, Operation Whirlwind, Buzzword, Mychess II, and Blue Team Bridge - all in their original boxes with instructions and diskettes

Your Atari Computer - A guide to Atari 400/800 Personal Computers

2 unopened boxes of blank diskettes, diskette notcher, and diskette vinyl storage holders

---------- End Forwarded Message ----------

The Printer I used (which will be for sale in a couple of weeks-once tested)
was a Seikosha AT-100. It had a built in Atari I/O cable along with another
plug to daisy chain devices through it. I didn't find the manual for it, so I
don't have any of the other specifics from it. I have it in its original box
and styrophome packaging material....

Yes, the Seikosha AT-100 also has the name AXIOM on the printer itself.

Well I've got an Okimate10 which featured cartridge like modules
(plug-n-print) that allowed it to attach directly to an atari, commodore or
standard rs232. Also featured black cartridges and three color cartridges.
It's thermal with replacable print head (I need a new one, anybody?) The
cartridges are/were made of thin plastic film which melted to the paper.
Thus a nice clean print job. Highly overpriced and not very hearty though.
Mo

My first modem was a MPP (? some number, 1000 I think.)
It connected thru joyport #2 and took a special handler.
It had some compatibility problems with the Atari 300 baud one
(a 1040?), speed was slightly off for the Atari one.
300 baud modems. Ran a BBS on it. Matt somebody wrote
AMIS MPP.

I have just listed all my ATARI Books and Magazines on Ebay -- all with $1.00 or lower start, with reasonable shipping terms. Some of these books have recently been asked about in this newsgroup. If interested, please follow the link to my auction list:

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?MfcISAPICommand=ViewListedItems&userid=bobbyshaw@aol.com

Here are the items for auction:

Atari 130XE Games Book
Atari Basic
Atari Basic Quick Reference Guide
Compute's First Book of Atari Graphics (2 copies)
Inside Atari DOS
Mapping the Atari (2 copies)
Microtext 2.0 program book
Mini Golf program book
The Atari Assembler
The Best of Atari Software
Understanding Atari Graphics
Infocom Witness Invisiclues book - Unused!
Your Atari Computer-A guide to Atari 400/800 Personal Computers
Lot of 34 ANTIC Magazines
Lot of 31 ANALOG Magazines
Lot of 10 Infocom Newsletters
Miner 2049er Cartridge

Thanks for looking!

Robert Shaw

>

Hi Mike. I got the Miner 2049er cartridge auction started on Ebay if you're still interested. Here's the direct link to it:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1321627167

Thanks!

Robert Shaw

339. fake newsgroup alerts (was: Final Notice ...)

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-13 06:32:36 UTC
From: Roy G Biv <erasmus@6502.chip.old.folks.home>
Message-ID: <Pine.GSO.4.33.0201130123500.9711-100000@shell1>
Source record: 31860

```
On Sun, 13 Jan 2002 at 03:16:55 GMT, "Kathleen Ferrante"
(KMFerrante at cfl dot rr dot com) scribbled:
->I guess we need to find another hangout.

These fake alerts are apparently part of a spam scam. They've
been all over the Usenet for several months. Ignore them.

->Atari8man

Huh? There seems to be a disconnect between a female header
name and male signature!

I know it's available on-line, but if you are still looking for a hard copy of the book, I have two copies of Mapping the ATARI listed on Ebay right now:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1321607680
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1321609281

The second one is in better condition. I also have a bunch of other books and magazines listed.

Thanks for looking!

Robert Shaw

For GODS SAKE. Remove the news.admin.net-abuse.email from your replies.

This is a bogus message from a spammer called HipCrime.

Once upon a time, in the land of the free (and the Yankee Dollar),
there arose a Spammer. He decided that it was his God Given Right to
post what he wanted, to as many newsgroups as he wanted, whenever he
wanted, and that no one should stop him. He used the handle "Hipcrime".
He went on to write some auto posting software, that hides the true
email addresses and began posting. Like a certain Saudi he attracted
followers. Also like a certain Saudi, he awoke the wrath of a sleeping
giant, namely those poor folks who have to deal with newsgroup abuse
reports. These guys fight him where ever they can, so he now targets
newsgroups with the "Follow up" tag in the headers set to the usenet
abuse newsgroup. (Go back and look at his original post and you'll see
what I mean).

Now when I replied to his post, I changed the follow up so that the post
came back here to comp.sys.atari.8bit .

Imagine what could have happened. Hundreds (O.K. so we probably don't
have hundreds here !) of people, all replying to his message, and
swamping the abuse news servers.

In reality, once created, it is *almost* impossible to remove a
newsgroup. There are thousands of news servers out there, all set up
differently. Many of the newsgroups they carry are empty as when
created, someone misspelt a word. In theory whilst one server carries a
newsgroup, it is still active.

Regards,

Barry Ruck. Harlow, Essex. United Kingdom

And the 1000E as well. The 1000E was even cheaper and had this strange
problem in that it could never hang up the phone. If a BBS caller didnt
disconnect
it would just stay connected forever.

Good evening everybody!

On ebay Germany someone auctions a module called "Tower Toppler", apparently a "Nebulus" port for the 8bit which has never seen the (commercial) light of day.

So. Can anyone shed some light on this game, i.e. how it came about, why it was not to be, and, lastly, if an ATR is download-able somewhere?

Hi,

>....What printers, other than those produced by Atari, can
>be connected directly to SIO without an intervening interface?

One of Epson's printers, I think it was the LX-80, used a system of
exchangeable interface "cartridges".

As well as the standard "Centronics" interface cart, I distinctly recall an
Atari SIO interface cart and a CBM serial bus cart. You could, BTW, buy the
printer off the shelf fitted with the interface cartridge of your choice and
get additional ones as required.

Star also produced a printer (I forget the model number(s)) which used a
similar idea for which an Atari SIO interface cartridge was available.

TTFN - Pete.

Hi,

> On ebay Germany someone auctions a module called "Tower
>Toppler", apparently a "Nebulus" port for the 8bit which
>has never seen the (commercial) light of day.

That's right, it is a port of "Hewson Consultant's" game "Nebulus" and was developed just after the 7800 port.

> So. Can anyone shed some light on this game, i.e. how it
>came about, why it was not to be, and, lastly, if an ATR
>is download-able somewhere?

It was developed by "Bob Armor" at "US Gold" here in the UK in early 1989.

At the time we were working on porting various UK releases to the 7800. Whilst I was porting "Jinks", Bob was working on "Tower Toppler" (Atari insisted on the name change). When he'd finished the 7800 port he was at a bit of a loose end while waiting to start on his next 7800 game - "Deflektor" - (and tinkering with a RAM cartridge he'd built to enable him to use the 7800 development software with XL/XE machines) so convinced the bosses that he could do an 8-bit port of "TT" quite quickly....it was mostly finished when I quit the company.

As for why it never appeared, I have no idea. My best guess would be because Atari decided to stop supporting the 8-bit machines?

TTFN - Pete.

Uh. Ok. You have an .arc of SpDOS toolkit. The .arc could
be just the files, or an .arc of the .atr. You mention your diskcomm
doesn't work, like in the same sentence. Was it a .arc of a .dcm
file? A busted diskcomm is possible, you can find a good one
at ftp.spudster.com in the utilities/files/archiver/diskimg.
You're not trying to unarc a .arc file with diskcomm.

Could you tell me more about AtariDsk? What is its purpose and what is the difference, compare to APE software ?

Is there a site (FAQ?) that I can learned about AtariDsk?

I learned about APE (great program) but I want to learn more about ATR tools (either for Mac or PC).

Thanks for the support! Trying to renew my Atari spirits! :o)

Mike

360. Which ATR files require more RAM than 800XL/130XE?

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-14 06:08:15 UTC
From: huggymike@aol.com
Message-ID: <20020114010815.10212.00004377@mb-fh.aol.com>
Source record: 31881

After browsing the files ftp.spudster.org/pub/Atari/CTH/Games2 (and Demo) site, I have questions regarding to the ATR file size in such FTP directory listing:

1) how can I tell which ATR files require MORE memory beyond the 64K in my standard 800XL?

2) how can I tell which ATR files require more RAM beyond the standard 130 XE's 128K ramdisk? (ie. 256k, 512k,1 meg, etc which I don't have.)

In other words, which ATR games/demos that will *not* work with my standard 800XL...and also 130 XE?

The reason I asked is that I am hoping that JOYRIDE (and other "great" megademos) will work on my 800xl. If not, and if it requires 130 XE (128+ memory or beyond), then I might have to find an XE in the ebay.com.

Finally, what is the working maximum RAM for 800xl? 130XE? (or a FAQ site where it answers my question as much as how do built/order such memory upgrade).

Hi
I have a question about PSU voltages:
Is there a way I can convert a 110V PSU to make it work with 220V ?
I live in a country that uses 220V, but I have a couple of
original Atari USA (110 V) PSU that can work only with 110V.
What kind of mod should I make? Maybe replacing some fuse?
Meybe a little soldering, swapping some cables?
I don't know, so any clues will be OK

Regards

ANTIC and CPU are always in extended memory according to the docs.
It uses bites 2-5 to select banks. So compatibility might be a problem.

> another I found is a 1-meg SIMM upgrade by the one-and-only Woolley:

Bob uses pin 4 to switch to extended RAM, pin 5 is use to choose banks.
This is how most upgrades do it.
But not mine.

Howdy folks

> Excuse me. Ever heard of an Interface PC -> Atari?

Sorry if I was a bit harsh.
I really don't like using PC's. Everything is so much easier on an Atari.
But the Atari needs more time. That's why I'ld prefer it, if PC users used
their PC's to make Atari files runable on PC's, instead of Atari users using
Atari computers to convert PC-files so they will run on the machines they
where intended for.

CU Mathy van Nisselroy

PS are there PC to Atari (via DCM or whatever format) convertors that can be
run from virtually every PC without the need to install anything?

If your mains frequency is 60 hz, then you can use a step-down transformer to change the 220vac to 110vac. These are fairly heavy, in a case, usually with a power cord and outlet attached. You might have to search a bit. Something rated from 220 to 240 vac on the input and 110 to 120 vac on the output is fine.

I don't recall if the Atari computer itself relies on the 60hz line frequency for timing. If so, and your mains frequency isn't 60 hz, then the step-down transformer won't be entirely satisfactory, as it can't give you 60hz from something different, its only changing voltages. I'm sure a FAQ can answer this question better than I can.

Some transformers have windings arranged such that you can apply 220vac to one pair or 110 to another on the primary side and still get out the right power from the secondary. As I recall the Atari power supply units aren't rigged this way- not unreasonably, as the extra winding and taps add cost & bulk.

If you're so inclined, you could certainly replace the Atari transformer with one that has a center-tapped primary and something like a 9vac secondary. If might be possible to use a 12vac secondary, but I've not looked deeply enough at the Atari 400/800 power supply board schematics to tell. If you do replace a PSU's transformer, make sure its rated for at least 18 VA, or at least 2 amps secondary current.

http://www.digikey.com is a fairly convienent source for transformers in the U.S.

Hello.
The complete SpartaDOS Construction Set Manual, in ASCII,
is now available at http://www.en.com/users/russg.
If you just need a quick command reference, the FTe 3.2g doc
might help.
If you want a complete reference for SpartaDOS, including
the technical structure of directories, memory locations for
command line, etc. the manual has it. Note there are a few
differences in 3.2g from what's in the manual.

377. How many more years before Atari computer dies?

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-14 16:21:04 UTC
From: Mike Stepansky <design3d@2-scale.com>
Message-ID: <B8686FA0.1D8D%design3d@2-scale.com>
Source record: 31798

Imagine this, skip forward to the year 2010 A.D....

You, Senior Atarians, are demonstrating a still-working Atari 800XL or 130xe to the public (or history class in school).

You boot up Mr. Robot, an eternal character, who is still striving and begging you to keep him alive...his mind is still in the 1984 only confined inside the tv tube and inside the Atari memory.

<do do dak deek dink dink dah dong boop...walking....springy on the trampoline... dawk deek do do beep bop beep do dak.... roll scores.... flash lights...next level...>

This is sad. He knows you, Atarians, are here to keep Mr. Robot alive as much as other Atari games with utmost care. He doesn't want to die!

I always wonder how many more years for chips or memory to survive inside XL/XE before they dies out. Finding the right electronics to repair might be difficult and expensive in the future.

How more years before floppy disks die out? I still even have 200+ floppy disks which were last written to them back in 1985 or so! Still readable!

I am more concern about the TRUE/REAL Atari hardware to continue using those ATR, backups, or well-taken-care of disks.

Anyone to share comment?

Yes, I will try my best to keep Mr. Robot alive, under my Atari Hippocratic Oath!

Well,
SOS thats just what I said - the "selfmade Operating system", created by Sijmen schouten. This alternate OS lets you boot from any drive (D1: - D8:) or partition, by just holding down shift+number key (1-8). Sijmen especially created this OS for his My-Ide interface, so he could boot from any of the 8 partitions. the Os can be downloaded on his homepage, however you have to burn the 16k BIN file onto an Eprom then and install it into your computer to use it as a new OS (or alternate OS).

I guess the My-Ide uses only half of the harddisk capacity, since it only handles 256bytes sectors (not 512 bytes sectors). but on the other hand, the MSC-IDE interface also merely used 256bytes sectors and still it could use the full capacity of any harddisk... -Andreas.

Well,
yes I am a member of ABBUC. I never had problems with the halle 1994
demo, but maybe thats because I have a 256k Compyshop Ramdisk. I always
thought the Halle demos merely use 64k RAM. Maybe you mean the
Hobbytronic demos from 1990-1992, i.e. a) "The hobby-tronic Power Pack
demo" which shows a rotating glashead and a rotating Trabant car or b)
"The starwars demo" which shows a walking and a rotating 2-leg walker
(AT-AT or whatever it is called) or c) the "Atari Hardware Demo" which
shows a rotating Atari 800XL. All of these demos have the same effects,
they upload several Gr.8 pictures into the extra-ram and then animate
these pictures, so as if they were rotating 3D objects... As of yet I
do not have any 576k or 1088k machine. And there are very few Atarians
here in Europe who have more than 320kbytes RAM. unfortunately we have
quite many different sorts of Ramdisk, so sometimes we do have
compatibility problems... -Andreas.

Oopps,
one thing I forgot: ABBUC now has the rights to all compyshop products.
thus you can get the Compyshop Ramdisk schematics from ABBUC floppydoc
erhard Puetz. don`t remember his e-mail or URL right now. but its easy
to find. I am however not sure if he has the schematics only avaiable as
paper(s) or nowadays also as graphics or pdf files or such...
-Andreas.

382. Re: 1050 Turbo from Bernhard Engl - 1050 Disk drive speeder

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-14 18:24:58 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3C43227A.E3A1EB5@students.uni-mainz.de>
Source record: 31803

Well,
the 1050-turbo or Engl-Turbo always used a GAL for copy protection purposses. Besides that Mr. engl always removed the numbers from all IC`s. He also made a turbo version, that was not placed on a free platine, but was inside a quader of rubber (or plastic or whatever). allthough you could not see or touch the chips here, he still removed the numbers from these chips. I know, because a friend of mine carefully removed the rubber, but when he laid free all the chips inside, he could see, that even these chips did not have numbers, arrggghh. Mr. Engl disappeared a long time ago, He took all the money he got from the selling of the turbo 1050 enhancement to buy a Porsche car. The first week he got this car he crashed it completely !!

So, for now there are no docs except the original Turbo 1050 documentation avaiable. also no re-makes of the turbo exist as hardware here in Germany. However, you know there have always been hackers and crackers. the guys from Compyshop wrote a turbo emulator for the Speedy 1050 enhancement. it works perfectly, i.e. all the turbo software runs on this emulator. Besides that some polish guys created a drive called Toms 720/710 or just Toms turbo. This drive uses the same speeder and the same format (sector skewing) as the Engl-turbo. thus all Toms turbo software can be run on the engl-turbo... I think for you it is much easier to buy a speedy enhancement from ABBUC and then use the turbo emulator for it. Or buy a Toms turbo if you find one. alternatively you can also buy a used turbo at the flea markets or Ebay. ABBUC Floppydoc erhard Puetz also has some replacements (not the GAL! which is the first thing that goes bad) for the turbo, so call him if you need help... -Andreas.

If you had the capability to burn a new OSrom with fast math routines
is there any reason not to do so?

Compatibility?
Timing issues with software/games?

Well,
the wormhole part of Halle 1994 uses more than 64k ?!? I am surprised,
since it does not look that pretty good (black and white, non-filled
vectors). take a look at MadTeam`s "X-Demo" which needs 320k RAM (but
which can be setup via a Ramdisk setup menu) to see a colorful 3D
wormhole (with filled vectors!). -Andreas.

Well,
I thought separate Antic and CPU access was possible through the Freddy
chip ?!? Maybe thats wrong. At least most expanded XL`s do not have
separate Antic and CPU access. thats why Video Blitz will not work here.
Besides that, I can switch off my 256k Ramdisk, but then I merely have
64k Ram (no Rd avaiable then). So video Blitz will still not work then.
On the other side, I am always using my 320k XL computer for almost
every purpose. Only for Video Blitz I have to dig out one of my three
XE`s with 128kbytes... -Andreas.
```

387. Re: SpartaDOS experts

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-14 19:05:08 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3C432BE4.898AF12A@students.uni-mainz.de>
Source record: 31808

Well,
- MyDOS has a Batchfile processor, called batchfile enhancement (written by Thorsten Karwoth, as you guessed it - a german Atarian; docs also avaiable in english at Mathy`s site).
-127 file entries ?!? well, I do not need that, MyDOS has subdirs, right ?!?
- Drive 9 ?!? Well, I use Drive 8 for the RD as do most of my programs (I would have to patch a lot of programs to use drive 9 instead).

- Time and date stamp ?? I do not need time and date stamp - and which atarian REALLY needs that ??? Most Atarians are powering their machines on once in a week (or once in a month or once in a year). so thats not needed much. I can still have a harddisk with lots of partitions or a BBS without any time/date stamp. Even on my PC I almost never need a time/date stamp. On jan. 1st 2000 my PC showed jan. 1st 1980; I still did not care and saved files with that time/date stamp. for MY private use a time/date stamd simply does not matter...
Since the Rtime8 clock (which Sparta uses) was not officially avaiable here in Europe, the time/date stamp of sparta is pretty useless. of course some Atarians imported the rtime8 clock, but most do no have it and then have to fool sparta or BeweDOS. when I setup BeweDOS, it is always the 31th of december 1999...

- move a file: well I miss that feature and some others in MyDOS (read my old texts, I wrote about MyDOS utility wishes...)
Yes, MyDOS could be much better and could have more utilities avaiable for it.
But still: I do not like Sparta DOS !! On the other hand let every Atarian use the DOS version he likes the most, might it be Sparta DOS, Bewe-DOs, MyDOS, Top-DOs, Turbo-DOs or whatsoever. As long as he/she still uses the little Atari... -Andreas.

388. Re: Atari 8-bit or C64 - games, gfx, nostalgia...?

Well,
it is a prototype cart. Someone found it at an Atari warehouse he
bought. Lance Ringquist (or maybe someone else) decided to put it on
cartridge. so you can order this prototype cart from Video 61 or B & C
or Best. Don`t think there is an ATR avaiable right now. But beware: the
game has never been finished, thus it crashes after the second
level/tower. normally there should be 8 towers avaiable. If you want a
good working version of Tower Toppler buy the 7800cart. Much better,
with more colors, more gameplay, no bugs and no crash after level two.
Still I cannot understand why they never finished the XL/XE game...
-Andreas.

P.S.: I do hope that the crash of tower toppler does not only appear on
PAL systems, however I do not have a NTSC system...

Hello mathy,
I have some more ATR or XFD converters for the A8 laying around here. If interested e-mail me. I can send them via e-mail (DCM if you wish) or snail mail. most of these tools did appear in ABBUC magazin however. A few ones are from Ken siders and the rest (if there is any) came from various internet sites i do not remember now... -Andreas.

Hi!
I'm trying to find the old Music Contruction Set for Atari 800.
I have one with a PRO disk format but I can't use it with any emulators.
Does anyone have one with an ATR disk format?
Or is there a utility to convert PRO disk format to ATR/XFD disk format?

Thanks in advance.

The Halle94 demo side B has a wormhole animation that will not display
unless you have the Compyshop Ramdisk.
The other 2 Demos you spoke about need a 256k rambo to run right, they do
not like the XE randisk at all.
It would be nice if all these great demos ran on all the diffrent type
ramdisk :)

Atari8man

"Andreas Magenheimer" <magea000@students.uni-mainz.de> wrote in message
news:3C431F7D.EE77C56F@students.uni-mainz.de...
Well,
yes I am a member of ABBUC. I never had problems with the halle 1994
demo, but maybe thats because I have a 256k Compyshop Ramdisk. I always
thought the Halle demos merely use 64k RAM. Maybe you mean the
Hobbytronic demos from 1990-1992, i.e. a) "The hobby-tronic Power Pack
demo" which shows a rotating glashead and a rotating Trabant car or b)
"The starwars demo" which shows a walking and a rotating 2-leg walker
(AT-AT or whatever it is called) or c) the "Atari Hardware Demo" which
shows a rotating Atari 800XL. All of these demos have the same effects,
they upload several Gr.8 pictures into the extra-ram and then animate
these pictures, so as if they were rotating 3D objects... As of yet I
do not have any 576k or 1088k machine. And there are very few Atarians
here in Europe who have more than 320kbytes RAM. unfortunately we have
quite many different sorts of Ramdisk, so sometimes we do have
compatibility problems... -Andreas.

Hi,

The XMOVE.com file is just great, menu driven and easy to use. It will move all the files you taged in 1 shot.
I love Bewe-DOs and have it on one of my partitions.
The new dos im using on floppies is Dos II, It's the most powerfull command line 2.5 klone I ever seen but dosnt support hard drives or subdirs. I think its from Poland.

Not exactly; it is software only. Allows a PC with 5.25 floppy to read and write true double density Atari disks from a Percom or Indus or US Doubler, etc drive. No cable, no electronics; simple solution if your systems support it with required hardware.

Hi Mike!

On 14 Jan 2002 05:32:25 GMT, HuggyMike wrote:
> Could you tell me more about AtariDsk? What is its purpose

With AtariDsk you can directly copy files from your PC to a 5.25"
floppy disk inserted into PC floppy disk drive, in Atari DOS 2
compatible double density (180k) format. You can also use it to
copy files from an Atari formatted floppy disk to your PC.

You could call AtariDsk kind of an "Atari DOS for your PC".

The biggest problem with AtariDsk is that it only supports true
double density (180k, 256 bytes per sector) disks. This means you
must either be using a double density upgrade with your 1050, or
a XF551 (or any other floppy drive that supports 256 bytes per sector).

> and what is the difference, compare to APE software ?

AtariDsk reads/writes your Atari floppy disk in the PC disk drive.
This means you can exchange floppy disks between your PC and Atari.

APE does something completely different: It simulates an Atari
floppy disk drive (eg a 1050) and you have to use a hardware interface
to connect your Atari to your PC (which now acts like an original
Atari floppy drive).

> Is there a site (FAQ?) that I can learned about AtariDsk?

Not really a FAQ, but have a look into the documentation that's
available with AtariDsk. Just visit my homepage at
http://www.horus.com/~hias/atari/ and download ataridsk.zip
The zip-file contains both the executable and the documentation.

so long & have fun with your Atari,

Hias

Hi there,

I have been cleaning out my Atari stuff, and have the following which I will sell in North America for $10 US shipped. These interfaces are untested and sold "as is". I have no time nor inclination to test them.

They are:

Ape Face Printer interface
R link RS232 Interface with manual and disk
An ATR link which is an SIO cable that allows 3 other SIO devices to plug into it.

I also have an Atari Track Ball and 3X7800 Joysticks which are also as is and sold for $10 shipped. The joysticks come in a bundle of 3.

I have an unworking Atari 1050 disk drive which I am sure the only problem with it is a broken drive belt. $15 US shipped.

Email me if interested in any of these items.

: inside the tv tube and inside the Atari memory.

: <do do dak deek dink dink dah dong boop...walking....springy on the
: trampoline... dawk deek do do beep bop beep do dak.... roll scores....
: flash lights...next level...>

: This is sad. He knows you, Atarians, are here to keep Mr. Robot alive as
: much as other Atari games with utmost care. He doesn't want to die!

: I always wonder how many more years for chips or memory to survive inside
: XL/XE before they dies out. Finding the right electronics to repair might
: be difficult and expensive in the future.

: How more years before floppy disks die out? I still even have 200+ floppy
: disks which were last written to them back in 1985 or so! Still readable!

: I am more concern about the TRUE/REAL Atari hardware to continue using those
: ATR, backups, or well-taken-care of disks.

: Anyone to share comment?

: Yes, I will try my best to keep Mr. Robot alive, under my Atari Hippocratic
: Oath!

: Mike

I still have my orginal Atari 400 from 1982, and it works fine. I expect
it will continue to work in the future. I once got a box of smashed apart
Atari 800's which were litterally a box of dead broken parts and
computers. From that box,I built an Atari 800 that never came from the
factory, but is a fully functioning Atari 800 in excellent condition.

I am sure that anyone who is interested in keeping a real working Atari in
their house can do so. I personally have decided against this "backup"
mentality, and have decided to rationalize my holdings. I think it is
possible to take care of a few Atari machines and keep them operational.
At least I indend to find out how long I can last in the Atari hardware
arena with just one 800xl, one 130xe, one 400 and one 800 (perhaps) plus
an xf551 and a couple of 810s and a couple of indus drives. I mean, that
might sound like a huge amount of Atari crap, but literally, it is a

fraction of what Im going to have to dump. Sooner or later space is more important than nostalgia. Lately, Ive not even been able to use my Ataris due to a lack of space. All this because ive become a depository for exiting Atarians who have given me their entire collections for a song.

And, of course, it helps if you have some documentation to help fix the things when they do break. However, with the number of users versus machines around, I suspect that anyone who wants to be using an Atari 20 years from now will still be doing so.

>warehouse he bought. Lance Ringquist (or maybe someone
>else) decided to put it on cartridge....

The guy who decided to put it on cartridge was the guy who wrote it (Bob
Armor) who sat at the desk next to mine.... :-)

>....But beware: the game has never been finished, thus it
>crashes after the second level/tower. normally there should
>be 8 towers avaiable....

Hmm, IIRC you should be able to play more than just two levels. But then it
HAS been a long time and my memory may be faulty on this point.

> P.S.: I do hope that the crash of tower toppler does not
>only appear on PAL systems, however I do not have a NTSC
>system...

You have a point, it was developed on an NTSC machine and never completely
finished/debugged after all.

TTFN - Pete.

I hope I get the name right, but yes Jim Hood died. He was the one that
really did the down and dirty work of putting articles together in a DTP
program and getting it out.

I don't think we have anyone left that is a combination of editor/DTP/good
nature, that could do it.

Anyone ever notice that when you NOTE a file right after opening it in Atari DOS 2.5, you get the starting sector and byte offset zero.

```
10 OPEN #1,4,0,"D:DOS.SYS"
20 NOTE #1,S,B
30 PRINT S,B
40 CLOSE #1
```

This same code doesn't work in Sparta though, rather the file noter/pointer is not initialized until some data is read. I found this out after hacking this old text adventure called "Alien Egg" so it would work under Sparta.

Actually MyDOS does this correctly and gives the same answer as DOS 2.5. Well, I still like Sparta, but this did irritate me a bit. I ended up changing line 20 like so:

```
20 GET #1,X:NOTE #1,S,B:B=B-1:POINT #1,S,B
```

Many thanks to Mathy for making good use of the black box ASPI manager by Matthias Belitz! Tonight my Atari was playing Mozart! Even my wife was impressed. I also read a 2k sector off of a silly burger king xmen 3" data cd that my daughter got this evening in her happy meal. The ASPI manager works very well and properly auto-detects all scsi devices on the bus and indicating which are cd drives. Of course, now I've just gotta have BBXFER for data CDs.

Uhm. John.
You said 'print a print image file to P:'. That sounds like you're
trying to send a .pic or other image file to your printer.
If so, it won't work. The only bit mapped image printing program
I know of is 'hiresdump'. It would print .pic files to a Star dot
matrix printer.

Message-ID: <3C44385C.42EB3654@mail.uni-mainz.de>
Source record: 31846

Well,
I used DOS XE on original atari and XF551. since there are different XF versions out there (with ROM or Eprom, with 8040CPU or 8050CPU), DOS XE also behaved different. On some drives it used XF highspeed and you were able to use all 4 formats (90-360kbytes). On other XF drives it did not use XF highspeed (maybe it did not recognize the drive as being an XF drive) and thus you could merely use 90k and 130kbytes. whenever I tried 180k or 360k there, I got an Error.
Furthermore the DOS2 to DOS XE converter did not work for me, I always got an Error when I tried to convert something to this DOS.

So, I gave up using DOS XE. And as I found out, all other Atarians did the same. No need to give it another try, since it is as useles as DOS 3, DOS 4 and other non-used Atari DOS versions... -Andreas.

P.S.: Nope, I did not use DOS XE on an emulator, since I almost never use emulators. (I merely use them as converters or directly use conversion programs for the different image formats...)

Message-ID: <3C443D05.3B8060FA@mail.uni-mainz.de>
Source record: 31747

Well,
my version of mercenary had both 48k and 64k versions on the same diskside. you had to hold down option or select to choose the one you wished. after a few seconds however the game automatically loaded the 48k version. Mercenary 2 (called "the second city") came as an add-on (tape or disk) for mercenary. it was merely playable with the original program. You had to load mercenary and after that you had to press some keys (Shift-L or Control-L and then shift-1 or control-1) to load in the second city (just as if you loaded a previously saved game). However cassette versions of mercenary could only load cassette versions of second city. Disk versions of mercenary could only load disk versions of second city...

The second city was a boring follow-up to mercenary. Besides that it had quite many bugs. For instance I remember, that there was one room (and only one!) where you found a triangle key - however this room was locked and you needed the triangle key (which was inside the locked room) to open it. weird, isn`t it ?!? Well, to solve this problem you had to use a disk/sector editor and change some hexbytes, I do not remember right now. the second city had more bugs like this and as of yet I do not know anyone who has ever solved this add-on. I don`t think that it is impossible, but just too boring. on the other side I know quite many users (and solutions printed in different magazines) that solved mercenary... -Andreas.

If do have DiskFormer 1.9 by Ken Siders. If you have something better, I'ld like that have that too. If they were on ABBUC magazines, please tell me which ones. Email will do. DCM would be great.

Howdy Michael

> I'd also like to do the same thing with printers. What printers, other
than
> those produced by Atari, can be connected directly to SIO without an
> intervening interface?

I'm not sure if this one counts, but.....
The General Electric TXP 1000 also known as 3-8100 had a detachable
interface on it's back. If you wanted to use a different computer, you just
took the special interface off and replaced it with a simular looking one
(except for the cable that you plugged into the computer) for that computer
and you were ready to go.

It was very popular in the Netherlands. One of it's advantages was that it
was fairly cheap in those days. The magazin of the Dutch Atari user group
had atleast one small item about this printer in each issue after they did
an article on it.

CU Mathy van Nisselroy

PS sorry, didn't find anything about the Supra Modem. Supra did sell the
2400 modem with it's Atari interface (supraVerter). But I distinctly seem
to remember that they also had a 300 baud modem for the Atari.

432. Atari Ramdisks...

Newsgroup: comp.sys.atari.8bit

From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <3C444AA5.5A1E079F@mail.uni-mainz.de>
Source record: 31752

Hello Folks,
could you please help me to compile a list of avaiable Atari 8-bit ramdisks or ram-enhancements ?!? The info should contain the following : name, Distributor/author, size, bankswitching area, used rambanks, used control bits, and everything else you know about it (if you have additional info). It does not matter if you cannot fill all infos, just give me or tell me what you know...

Ok, let`s start with some examples here (sorry, I am not a professionel in this subject, so the examples could include errors or false information)...

Name: distributor size bs.area
rambanks control bits etc. etc.
- Axlon Axlon/Atari 64k C000-FFFF
??? ??? 800-platine-board, 400/800 only;
- Axlon Axlon/Atari 128k C000-FFFF
??? ??? 800-platine-board; 400/800 only
- are there more Axlon ramdisks / ram-enhancements with other sizes ??? (what bankswitching area do they use, which rambanks, which control bits, etc. ???)

- Mosaic ??? 64k C000-FFFF
??? ??? 800-platine-board; 400/800 only;
- Mosaic ??? 128k C000-FFFF
??? ??? 800-platine-board; 400/800 only

- 130 XE RD Atari 64k 4000-7FFF
E3,E7,EA,EF control bits ? the standard for all XL/XE enhancements; afaik controlled via Port B($D301);
- Megaram 1+2 Compyshop 256k 4000-7FFF Rambanks: 23,27,2A,2F,63,67,6A,6F,A3,A7,AA,AF,E3,E7,EA,EF; control bits ??? most common RD in Germany (Megaram 1 with 16kbytes chips, megaram 2 with 64kbytes chips, Megaram 3 with 256kbytes chips); afaik controlled via Port B ($D301)
- Megaram 3 K.Peters 256k or 1MB 4000-7FFF
Rambanks unknown control bits unknown; uses 1 or 4 rambanks of 256k each; afaik the whole 1Megabyte is controlled via Port B ($D301 and $D602); very incompatible to all other 1MB ramdisks...
- Newell: ??? (FTE); which sizes ??? rambank-area ??? which rambanks ??? which control bits ???
- MIO: ICD (FTE); which sizes ??? rambank area ??? which rambanks ??? which control bits ???
- Rambo XL which distributor ?? which sizes ?? rambank area ?? which rambanks ??? which control bits ???

- Yorky XL: which distributor ?? which sizes ?? rambank area ??? which rambanks ??? which control bits ???
- K. Buchholz upgrade: K.Buchholz, which sizes ?? rambank area ?? which rambanks??? which control bits ?? (afaik this or the P.Petersen Ramdisk used 32kbyte rambanks, thus not 130XE compatible ?!?)
- P.Petersen/ABBUC: P.Petersen, which sizes ??? rambank area ??? which rambanks ?? which control bits ???
- B.Wooley Ramdisk: B. Wooley, which sizes ?? rambank area ??? which rambanks ?? which control bits ???
- TOMS ramdisk: T.O. + M.S. size: 192k, 256k, 576k and 1024k; rambank area unknown (most probably 4000-7FFF), rambanks unknown, control bits unknown,... standard in Poland (and maybe other eastern european countries);
- Atari magazin Ramdisk: author unknown, size 128k or 256k; rambank area = 4000-7FFF, rambanks unknown, control bits unknown; this was a selfmade RD from Atari magazin / Germany;
- 600XL upgrade: Compyshop, 192 or 256k, rambank area 4000-7FFF, rambanks are equal to Megaram 1+2; upgraded to 64k RAM + 192k or 256k extra Ram;
- Mathy`s RD: Mathy van Nisselroy; size: 1024kbytes, 4000-7FFF, all the rest is unknown to me...
- etc. etc.

As you see there are dozens of ramdisks (and dozens I did not mention here). Well, if you have a ramdisk / extra ram avaiable, please give me some info, what you know about it. You see, I do not know much about ramdisks (almost nothing!) so every little info might help. In the end I hope to compile a list with many/most avaiable ramdisks for the little Atari. This list should help you and especially programmers to have an overview and thus avoid compatibility problems in future program releases (especially for programs that need extra-ram). Next, I plan to compile a list of programs that a) support extra ram (but still work on 48k or 64k machines) and b) absolutely need extra-ram / ramdisk.

Since quite some programs tell you which rambanks are needed, I could then be able to tell you which RD they will support or not support. Ok, don`t be upset of this long text, just write me some infos you have about your ram upgrade, ram enhancement, extra ram or ramdisk. I am waiting for your responses... -andreas.

Source record: 31754

I know very little about ramdisks.
I have a Newell 256k 800xl. It is supposed to be pretty good
130xe compatible. It uses PORTB to control the banks.
The MIO comes in 256k and 1 meg flavors. The MIO ramdisks
are in the MIO, so they aren't accessable like in the computer
ramdisks. I leave the MIO on all the time, you can boot from it.
The MIO RAM can be configured to be print spooler or different
size ramdisks. I always made 180k dbl density ramdisks, you can
do 1 on a 256k or like 5 on a 1 meg.
Software ramdisks. I don't think you mentioned the RD and RDBASIC
that are SpDOS ramdisks. John Picken ramdisks RM and RM66/67.
And the PSI ramdisk.
I don't use ramdisks much, except the MIO ones when I used to
run a BBS.
There were a couple word processors that used extra RAM (paper
clip II). Disk Communicator will use all your extra RAM, but
asks. Tom Hunt's program that allowed sorta multi-tasking required
at least 128k, I think. Then there are some demos that require extra
RAM.

Boy is the 3.2g COPY command dumb. It was an effort to prevent
overwriting a file. Dan's COPY FILE.EXT P:* might work.
Someone (Fox-1 I think) says COPY FILE.EXT E1: worked.
Maybe that would work. It would be pretty easy to do in BASIC.

```
10 DIM A$(40)
20 ? "INPUT FILESPEC eg. D:FILE.EXT"
30 INPUT A$
40 CLOSE #1
50 OPEN #1,4,0,A$
60 CLOSE #2
70 OPEN #2,8,0,"P:"
80 TRAP 300
90 GET #1,X
100 PUT #2,X
110 GOTO 90
300 TRAP 40000
310 CLOSE #1
320 CLOSE #2
330 END
```

It would be slow, but probably would work.

Two different interfaces, one for use with Nick's software and one for use
with Steve's.

1050 to PC is Nick's, Prosystem is Steve's. They are not compatible.

hi pete,
so you were the guys who were doing the mysterious work for atari in
the u.k.
julie wade once complained to me that you guys were late with some
stuff, and that it was to late to release it, so she was going to
destroy any game that was sent to atari from the u.k. that was done.
my queston to you is what did you guys do that atari did not release on
the 7800, or the 8-bit?
thanks,
lance

Hello Russ,
I can send you (and everyone else that is interested) a small ramdisk test program. It will test XE-compatible Ramdisks (Port B $D301, 4000-7FFF) and a) show their used rambanks and b) show their used control bits. Think this program can test the Newell at least. The MIO was a PBI device, wasn`t it ??
greetings, Andreas.

440. Re: mydos vs. sparta

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-15 20:32:27 UTC
From: Dan Vernon <dan@bitsofthepast.com>
Message-ID: <a223f4$9pn$1@nntp9.atl.mindspring.net>
Source record: 31760

The last post about this was only true when accessing the Atari DOS 2.5 filesystem. When using the Sparta filesystem, NOTE and POINT behave differently. NOTE works more like the unix ftell() in that it gives no sector, offset information, rather, just a zero based offset in bytes into the file. This actually makes much more sense than the standard NOTE/POINT that exposed the implementation details of the filesystem. For the "Alien Egg" adventure, all of its datafiles were indexed with the old Sector/Offset NOTE/POINT mechanism. To make this one work on a Sparta filesystem, I had to convert the index like this:

old code:

```
100 POINT #1,SECTOR,BYTES
```

new code:

```
90 Z0=0
100 OFF = SECTOR * 125 + BYTES: REM 125 bytes per sector in Atari DOS
110 POINT #1, OFF, Z0
```

Its a little stupid, but at least I didn't need to re-index the data files. I probably should add code at the top to set a flag for Sparta or MyDOS, and then act appropriately.

-Dan

Hi Russ!

There it is, right in the Construction set manual. All my confusion about NOTE/POINT behavior under sparta is explained in "Chapter 19 - The Technical Structure of SpartaDOS". Thanks very much for the scanning and OCR'ing -- I've done a fair amount of this myself and its not a simple task.

Hello,

For one, I expect my 400/XL/XE computers to last forever. Afterall,
they have lasted this long without problems. Even if they did, there is
places like Best Electronics that will repair them. I realize that the
disks are getting old. I am in the process of gathering ATR images to
convert onver to DI images. I will end up putting them on a CD and will
use them with my Atari Hades clone, my 130XE and a SIO2PC cable.

>....however you have to burn the 16k BIN file onto an
>Eprom then and install it into your computer to use it as
>a new OS (or alternate OS).

Thanks, I had a look at his website earlier and found it....I'd only looked at the "MyIDE" page before, rather than the entire site.

I'd assumed that it was a DOS rather than an OS replacement.

Has anyone produced an open-source DOS for the Atari?

> I guess the My-Ide uses only half of the harddisk capacity,
>since it only handles 256bytes sectors (not 512 bytes
>sectors)....

This is what I'd assumed too. However, after browsing the website it looks to me like he's actually running the drive in 16-bit mode and simply ignoring the upper 8-bits, hence you're losing half the capacity. :-(

I'll have to look over the schematics to check, but that's my gut feeling.

TTFN - Pete.

I agree with this, Ron. That is why it looked to me that there is
inconsistency between the last schematic (ProSys) and the "How to
build the ProSys Interface". Other than than, I'm looking for some
guidance as to which one is correct.

ron

> build the ProSys Interface". Other than than, I'm looking for some
> guidance as to which one is correct.

If you want to use Steve Tucker's Prosystem, then the bottom schematic is
right. They are labeled something like
[MAX232] top
[75C189, 14C89] middle
[14C89] bottom

To complicate things a little further, you can wire the zener across pins 7
and 14 if you don't like the way it works for voltage drop. It works fine as
is, just a matter of style.

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 01/16/2002

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection list for this system is currently on-line!

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 2.00 Missile Command
$ 1.50 Space Invaders
$ 3.00 2-pack: Missile Command and Space Invaders

Box and manual only, no cartridge:
$ 1.50 Millipede

Manual only, no cartridge or box:
$ 1.00 Galaxian

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 3.50 Atari 1010 Program Recorder Owner's Guide (16 pages)
$ 3.50 Atari 1200XL Home Computer Owner's Guide (20 pages)
$ 6.00 Atari 65XE Personal Computer Owner's Manual (138 pages)
$ 3.50 Atari 800XL Home Computer Owner's Guide (24 pages)
$ 3.50 Atari BASIC Reference Guide: For Experienced Programmers
(16 pages)
$ 2.00 Atari Home Computers: The Next Generation catalog
(32 pages)
$ 6.00 2-pack: Atari Disk Operating System Reference Manual:
DOS 3 (112 pages). Lot also includes An Introduction
to the Atari Disk Operating System: DOS 3 (32 pages)
$ 6.00 Inside Atari BASIC [Atari / Reston] (196 pages)

[Pictures of the items listed below will be available soon]

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive does not include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$ 2.00

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.95 for the first
game and $1.25 for each additional game. Shipping for hardware and
accessories depends on weight/distance. Large orders will be weighed
as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and
systems have been tested and are in working order. I very

rarely sell items that aren't working, but if I do, they are
clearly labeled as such.

3) Trade offers, in particular for items that I need, will be
considered (especially if the trade offer overwhelms me). I
collect for over 50 different systems, so please feel free
to send me a trade list.

4) Buyer has seven (7) days to send payment, and pays all shipping
costs. Shipping cost depends on both the weight of the order
and the distance that the order must travel, unless a set
amount is already listed. No orders will be sent C.O.D. So
if you can't mail the payment within 7 days, please do NOT order!

5) Since items will be held specifically for you, if you aren't
serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly
listed. There is no minimum order.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either Personal Check, money
order, Cashier's Check, cash or PayPal. Orders from outside the
U.S. are also accepted (postal money order, PayPal or cash only!)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

454. PhillyClassic3 Official Update!

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-16 11:46:29 UTC
From: mpallante <mpallante@cox.net>
Message-ID: <pKd18.1380$vT4.204354@news1.east.cox.net>
Source record: 31775
Cross-posted to: rec.games.video.classic,rec.games.video.atari,rec.games.video.sega,rec.games.video.arcade,rec.games.video.nintendo,rec.games.video.misc,rec.games.video.sony,comp.sys.atari.8bit,comp.sys.amiga.games

Update 1-16-02

The holidays are over! The new year has begun! Ladies and gentlemen, it is time!

PhillyClassic is now deep into the planning stages. Here's the rundown:

* The dates, time and location are all set. PhillyClassic will happen April 26th and 27th, 2002 at the Valley Forge Convention Center in Valley Forge, PA. 15,000 square feet of gaming goodness! Doors open at 5:00 p.m. on Friday to the public and close when we get thrown out! :) Saturday morning we let the ticketholders in bright and early at 9:00 a.m. and play, play all day!! More scheduling to come soon!

* Tickets and tables are now on sale! All payments can be made through PayPal to Phillyclassic3@yahoo.com, or visit the website for info on where to send checks and money orders. Tickets are $10.00 pre-ordered and $15.00 at the door.

Tables are priced at:

UNPOWERED TABLES:
1st table - $20
2nd table - $30
3rd and subsequent tables - $40

TABLES WITH POWER:
1st table - $30
2nd table - $40
3rd and subsequent tables - $50

VENDOR/CORPORATE TABLES:
$100 Unpowered/$150 with power

The reason the tables are priced differently this year for powered vs. unpowered is because this year we're being charged by the convention center for electrical needs.

The other difference in table pricing (the $20/$30/$40 progressive setup) will allow for the most possible people to get a single table, and to put a fair price on tablespace for people who plan to move a LOT of goods.

* We also have Corporate space available and are talking to a few big companies about attending and getting out to the gamers like you directly!

* Tournament scheduling is well underway. We have 3 set tournaments at this time and will be adding one more system tourney and two arcade tourneys!

* We have given over 1/4 of our total space for - get ready - upright arcade games ON FREE PLAY!!! Wow!! If that arcade at your local mall is as disappointing to you as it is to us then make it a point to at least come down for this part of the show! You won't regret it!

* Like the more current systems as well? Fear not! We have not forsaken you! Many of us will be featuring Playstation2, X-Box and Gamecube along side our beloved Atari, Intellivision and ColecoVision systems!

* Join our Yahoo! mailing list to get updates directly as well as discuss the show with others and set up personal trades for the show! Join here: http://groups.yahoo.com/group/phillyclassic/

* Check in at our website at http://www.phillyclassic.com for late-breaking news, updates, accomodation recommendations, driving directions and more!

We look forward to seeing you at the greatest PhillyClassic yet!

http://www.best-electronics-ca.com has both repair manuals and the hardware
to fix your computers.
If a photocopy of the manuals is enough, try
http://www.abbuc.de/bauplan/xl_xe_bauplaene.htm the site is in German, but
the titles are mostly self explanatory. E means text is in English. Joost
speaks English if I remember correctly.

Thanks!

What's stopping ye'?
There's a file somewhere on CD Data stucture of an ISO 9660 disk. I'll
check at home what that site is called. (there's two legal ways to get this
document off the internet. One is via ISO, who wants money and one is for
another organisation who doesn't want money.)

CU Mathy van Nisselroy

PS what version are you using (CDAP)?

458. Joystick for PC

I`m searching for a digital Joystick to connect on PC, so I can play the good old Atari Games. Perhaps the original Atari Joystick or Competition Pro ?

459. 400/800 os roms for xl/xe

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-16 19:26:29 UTC
From: Dan Vernon <dan@bitsofthepast.com>
Message-ID: <a24jvgfvd1@slb6.atl.mindspring.net>
Source record: 31780

I'm wondering if anyone has opinions they'd like to share about which of the "original 400/800 OS" roms for the xl/xe computers is the best.

I realize that one can use one of the many translator disks for ths; however, one of the things I like best about my atari is that I just flip a switch and right away I'm doing what I want to do. No waiting for reboots, disk scans, registry cleansing, wasting hours re-installing the OS every few months, etc., etc. that is for frustrating when working with most modern systems (especially those running OSes put out by a large corporation in Redmond, WA...). Furthermore, there are many carts out there that will only work with a rom translation solution.

OK... with that said, I've got two no-name translator roms in an 800XL and 130XE. Not sure what these are, but the memo-pad mode comes up completely blank. Another I have in a 1200XL, called XL-BOSS. The memo-pad mode comes up with the three letters "XLB". Then I have a machine with Steven Tucker's WARP 4-in-one-OS, and the memo pad mode in that one looks just like the old 800. Beyond this, I've heard about a rom called FIXXL (or is it XLFIX?), which perhaps is the rom in the two machines I mentioned at the beginning of this paragraph, but then again perhaps not.

Questions:

1) are there other translation-roms out there? If so what are the names? How can you identify them?

2) Which works (or is reputed to work) the best? Which is most compatible with the 400/800 machines? (Maybe they are all about the same?)

3) is it possible to create an OS that is compatible (to some extent) with the 400/800 OS, and includes the PBI drivers?

-Dan

Hey the dude holding the 800 looks just like an ad in my 1980 BYTE magazine!
The tie looks different though. To be honest in representation though, he
should be wearing a 'what me worry' T-shirt with holes in it along with a
matching pair of holy jeans (Levis). The hair should be 2 to 12 inches
longer as well. This guy looks like he should be holding a Dell laptop!
HaHaHa
Nice layout and very complete archive though! I'll be checking in often!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Mathy van Nisselroy wrote:

> Then why does it work on the XEGS?

Mmmmm, perhaps because Atari had found more tolerant design through
revisions by the time XEGS was designed (which came out couple of
years later than XE's IIRC)?

(Hey, I did say it was to be a blind shot ;)

> Maybe I made a mistake soldering things in......

I'd be happy to do the mod myself to provide a data point, then again,
I don't have any Black Box to test with *^_^*.

470. Will these games work on a 600xl??

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-17 16:15:59 UTC
From: myemail@home.com
Message-ID: <3NC18.47470$JF.434169@rwcrnsc52.ops.asp.att.net>
Source record: 31791

I have just recently aquired an Atari 600XL computer. So now I am looking for some software/cartridges to use with it. Upon surfing and lurking on Ebay I haven't yet been able to tell if the "Plays on Atari 400/800/1200 xl/xe systems" means that they are playable on my 600xl. I would assume so because of the xl.

Anyone?

Thanks

unless someone has upgraded your 600xl, it is only 16k, which means
only 16k games will work on it.
visit our web site at,
www.atarisales.com
click on the 400/800/xl/xe cart list, and we give the memory requirments
after each title.
thanks

Source record: 31793

I would guess that if it mentions both 400 and XL you should be safe. the
400 was only 'officialy' expandable to 16k (your memory limit), third party
expantions could take it higher. and XL will cover the operating system
differences.

Everyone here (well, everyone in csa2 anyway) knows Woz wrote Integer BASIC,
and I'm 99% sure (bad pun) that TI BASIC and Extended TI BASIC didn't come
out of Redmond (or wherever Microsoft was based at the time). Once you get
beyond the simplest stuff, the syntax (and sometimes the semantics) of TI
BASIC diverges quite a bit from the various Microsoft BASIC variants.

There are a few more BASICs that weren't derived from Microsoft BASIC.
Atari had its own BASIC; the biggest difference that I recall was that it
didn't support arrays of strings. MS BASIC for the same machines, which was
also available in a different cartridge, does provide support for arrays of
strings. I think Tandy rolled its own Color BASIC for the CoCo, but
Extended Color BASIC identifies itself as a MS BASIC variant (I'm guessing
this is the case as standard Color BASIC doesn't include the "under license
from MS" line in the boot message that Extended Color BASIC includes).

That said, given the original post regarding PRINT 23+"23"+-23 and its
result...shouldn't that come back with a type-mismatch error? The +
operator is overloaded, but you can't concatenate a string and a number and
you can't add them together. Does Applesoft do something other than report
an error? (I'm at work right now, so I can't fire up one of my IIs and
check for myself.)

There are and were many derivations of basic. MicroSoft had great marketing
(but a bad product).

All three versions (C64, Atari 48k & 64k) were on the same side of the disk.

But it's true. I have it right here before me. (The original Mercenary 2, that is) I remember, I was very impressed by this, couldn't believe it either. But it works. I've tried it on both machines. (-:

478. APE cable

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-17 22:48:19 UTC
From: John McCulloch <mcculloch@accesstoledo.com>
Message-ID: <Twl18.332190$m05.26816420@bin5.nnrp.aus1.giganews.com>
Source record: 31699

Anyone know who makes APE cables? It's like a SIO2PC cable, but uses DSR instead of RI for the SIO command line. I'm having a problem with my SIO2PC cable used with APE. I built a short extension which moves the RI signal (DB9 pin 9) to DSR (DB9 pin 6) and still having a problem with printer support although disk support still works great after telling the software that I'm using DSR now.

I ought to make my own cable but I don't have a soldering iron good enough for electronics (just a high temp cheap crap iron) and was wondering who could make one for a reasonable price. My SIO2PC cable has no "box" on it and I can't see how the 1489 or compatible chip and the other devices can fit in the SIO connector hood or the DB9 hood so I think the guy that made my cable cut some corners, or else he's a genious in electronics consolidation.

Any ideas?

Thanks,
John

Source record: 31701

Andreas Magenheimer wrote

: - Time and date stamp ?? I do not need time and date stamp - and which
: atarian REALLY needs that ???

"Need" is a big word, but I couldn't do without it. When coding, it's very easy to check which piece of sourcecode is the most updated one.

: Most Atarians are powering their machines
: on once in a week (or once in a month or once in a year). so thats not
: needed much.

Both systems with Black-Box and harddisks are powered on 24/7

: I can still have a harddisk with lots of partitions or a
: BBS without any time/date stamp.

Pro!-BBS needs the TD/stamp. It's also handy to check when a file is uploaded.

: Since the Rtime8 clock (which Sparta uses) was not officially avaiable
: here in Europe, the time/date stamp of sparta is pretty useless.

Yes it was. Officially imported by Bo and Ernest Schreurs, authorized non-profit dealers.

: Yes, MyDOS could be much better and could have more utilities avaiable
: for it.

Same with Sparta-Dos.

: But still: I do not like Sparta DOS !!

That's a true statement :-) I don't like menu's, so I also don't like My-Dos, DOS 2.5 or what ever. If I want to be DOS 2.x compatible I use TurboDos or X-Dos, which are 99% disk-file-format-compatible and 98% vector-compatible with the bonus to use double/quad denstiy.

: On the other hand let every
: Atarian use the DOS version he likes the most, might it be Sparta DOS,
: Bewe-DOs, MyDOS, Top-DOs, Turbo-DOs or whatsoever.

You forgot about BiBo-Dos? :-)

I actually only use it to get a directory from a disk if I didn't had Sparta-Dos started up, and this is only cause it loads quicker from the ROM of my 1050 Speedy compared to Turbo-Dos from my Turbo-Speedy :-)

Andreas Magenheimer wrote

: Besides, what happened with the Fox-1 or TXG 1 Megabyte Ramdisk ?!? did
: they merely build it for themselves or would they build it for other
: Atarians too ??

It's not mine, it's TXG's. The upgrade works, has been testdrived, one proto has been built, so everything is ready except for one (actually 3) important thing: the manual, drawing and instructions how to build one yourself. Rene has started working on that a few weeks ago. Haven't seen him since jhv. The only thing I know is that he's still alive, since he called me yesterday.

Source record: 31704

Hello all,

My ISP (really my cable company) pulled comp.sys.atari.announce off their server a couple of days ago -- no explanation. They have an on-line chat window with a tech support person. I used it to ask why the newsgroup was pulled, and to ask if it can be reinstated. She said she'd talk to the newsgroup people, but that I should also write to support and let them know what I told her and she told me. She also said I should wait a few days for an answer.

Today I got an answer. It said that since I spoke to somebody on-line, they're confident that my problem was solved.

Interesting.

Meanwhile, is anyone else having this problem?

Take care.

Alan

Has anyone played these on their Atari 8bits?

I was reading a old PAGE 6 Magazine and they reviewed both of these for the
8bit,
but I've never seen them, or heard anyone saying they had them.

So if you have em, what are they like? Better yet, got a ATR of them?? ;-)

Regards

Aaron

hi,
turn on your 600xl, type in these instructions,
print fre (0)
then hit your return key,
you should get a five digit number, if the number starts out 13etc.,
its 16k, but if its 37902, then you have a 64k machine.
b&c computervisions , and best electronics have 64k plug in modules for
the pbi port on the back of your 600xl,
thanks,
lance

```
No, all R/S basics were Microsoft, except the original Level I Model I
(which was Palo Alto hacked), and the Model II compiler, which was Business
Basic IIRC.
The 8K Color basic for the Coco, and the MC-10 were MS.

Just a small point- Atari BASIC did support string arrays. The
incompatability was in the fact that Atari used ATASCII while everyone else
used ASCII. Also it featured alot of additional graphics and sound features.
Atari did release Microsoft BASIC and Microsoft BASIC2 under the Atari
packaging. These proclaimed themselves to be more compatable with TRS-80
BASIC (not quite though). For more info check out comp.sys.atari.8bit

Well, it was me if i remember correctly.
All fits perfectly well inside SIO shell. I admit, it is the simpliest design
possible: just the 14c89 and a diode. But it works for at least a few hundreds
of people. If you needed the lines switched you should have told me. Although
I dont think there is anything to do about the hardware itself: your extension
is definitely good enough equivalent and you will most likely not benefit from
new (APE) cable. Thats IMHO of course. You may always try one of the more
complicated designs - two chip, MAX232 etc.

Atari Basic didn't exactly have string arrays, but you had to DIM every
string
variable to set a maximum length, and it used A$(3,5) instead of
MID$(A$,3,3).
A string variable could be up to 32767 characters long, vs. 255 for most
other Basics of that time.

Howdy folks

You can now find the latest version of MyRD, the MyDOS RAMdisk driver by Lee Barnes on my site. It will auto-detect if the RAMdisk is installed (by MyRD) and skip formating if it is (on cold boots without power cycling). There is even a version that will auto detect how much RAM your computer has. So now you can boot computers with different RAMdisk sizes from one floppy without reconfiguring.

So does mine. I checked with the multimeter yesterday.

If you placed the BlackBox so that the power connector is at the left side, pointing away from you, with the PBI connector toward you (as on most pictures), the pins are, from left to right:

1) -5 or -12 VDC (Bob Puff told me it can be either since it's only used as a reference.)
2) +12 VDC
3) Ground
4) +5 VDC

I really need to find out what is causing this. The stupid thing is, if I
use trace (a Turbo Basic command), it doesn't happen.

The docs are at:
http://www.ecma.ch
Click on 'Publication'
Then where it says 'ECMA Standards (blue Cover)' on 'List'
Choose 'ECMA-119'
Then choose if you want it in PDF or PostScript.

Then go to http://www.cdroller.com/htm/readdata.html to get an idea of how
everything is connected.

We had this disussion of the TI on the TI Online Users Group at Yahoo
Groups!
Unfortunately, Microsoft did write TI Basic, and either TI updated
their code in Extended Basic or they wrote that as well.
TI had very strict guidelines - the BASIC had to meet ANSI minimal
requirements. Therefore, there were syntax differences.
BTW: PRINT 23+"23"+-23 in TI BASIC gives:
* STRING-NUMBER MISMATCH

"&" is the concatenation operator on the TI.

Only the 6502 version, e.g. Apple and Commodore, is affected AFAIK. I
assume the TI computers used a TI processor, didn't they?

> "&" is the concatenation operator on the TI.

Is that ANSI?

If you find TI brochure's (or even the back of a TI box) they mention it is ANSI (or ANSI minimal). I don't think at the time the standard had been finalized.

>
>Only the 6502 version, e.g. Apple and Commodore, is affected AFAIK. I
>assume the TI computers used a TI processor, didn't they?

Yes, they used a TMS9900. But Microsoft wouldn't have had to write in 9900 assembly, as TI provided an interpreter, GPL (Graphics Programming Language). TI BASIC is mostly GPL code. I'd say GPL is closer in syntax to other processors assembly language than 9900 is. But this also means the BASIC interpreter which is interpreting your program is ALSO being interpreted...
Anyway, there were references on the TI Online group to a book about Microsoft and Bill Gates, which included references to their hand in TI BASIC, and how they disagreed with TI's adherence to what TI thought would become the standard.

>
>
>> "&" is the concatenation operator on the TI.

I don't know, but I find it in more modern versions (i.e. VB6)

Yep, And they said they were out for the Atari 8bit & ST, but the reviewed copies were for the 8bit! So they were definately finished. As page 6 made a point of not reviewing beta or prereleased copies.

I hope someone out there has them, as I'd love to see them.

If I get time, I'll scan the review and put it online. two pages.

Good call... the problem is, electronics parts tend to carry different
ID numbers here (in Japan), and I'm nowhere near fluent in the
expertise to match equivalents. Plus, I'm *SUPER* lazy (observe how
long it took me to go for supervideo *^_^*).

I'll start shopping around anyhoo (starting with CO25953! ;).

509. FA (Ebay): ATARI books/magazines-ends Saturday night

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-18 23:12:57 UTC
From: bobbyshaw@aol.com
Message-ID: <20020118181257.08631.00003449@mb-ch.aol.com>
Source record: 31730

There is one more day left on my auctions for my ATARI books and magazines. I bought a scanner this week, and updated all the images from my cheapo $20 digital camera to nice looking scans, so if you looked when these started, you can now get a better look at what you're bidding on. Below is a link and a list of the auctions and their current bid amount (as of 6:00pm EST Friday). If you are interested in any of the items, please take a look.

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=bobbyshaw@aol.com

Atari 130XE Games Book - $1.00
Atari Basic - A Self Teaching Guide - No bids ($1.00 start)
Atari Basic Quick Reference Guide - No bids ($0.45 start)
Compute!'s First Book of Atari Graphics #1 - $1.00
Compute!'s First Book of Atari Graphics #2 - No bids ($1.00 start)
Inside ATARI DOS - $5.50
Mapping The ATARI book #1 - $1.00
Mapping The ATARI book #2 - $1.00
2 BASIC source code books-Microtext, Mini Golf - $0.45
The ATARI Assembler book - $2.25
Understanding ATARI Graphics - $10.50
Invisiclues-The Hint Booklet for The Witness - $0.50
The Best ATARI Software - $1.00
Your ATARI Computer-A Guide to ATARI 400/800 - No bids ($1.00 start)
Miner 2049er Cartridge w/manual - $3.25
Lot of 34 issues of ANTIC Magazine for ATARI - $17.00
Lot of 31 issues of ANALOG Magazine for ATARI - $8.79
Lot of 10 issues of Infocom newsletter - $26.00
Lot of 4 misc ATARI Magazines - $5.50

Thanks for looking!
Robert Shaw

I am looking for someone to convert a cassette - to a format that will work with Atari800Win. I have tried but don't have the correct hardware to do this. I have created a working copy of the game and will ship it to you to convert. Please let me know if you are interested. Thank you in advance for your cooperation.

Yes...the TMS 9900, the first 16-bit microprocessor. (It's too bad that TI
BASIC was written to run on the graphics controller instead of the main CPU,
which is what made it dog-slow. The 99/4A should've blown everything else
on the market out of the water performance-wise.)

My IIGS got wedged when I tried the PRINT statement given above. I have an
enhanced IIe, a II+, and a VIC-20 available that I could try this
on...except for the IIe, they're all "buried" under other stuff, though.

A Ha! So *THAT* explains why printing characters to the screen was as slow
as molasses! I always wondered why printing a single character to the screen
was slower than pasting an entire array to the screen using a single graphics
call.... The graphics call was accessing the machine directly while the
PRINT was using a two-pass interpreter? Weird!

516. Is it possible to program emulators to load from wav file?

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-19 01:06:26 UTC
From: Dirk the Daring <dirkthedaring@charter.net>
Message-ID: <u4hhlt2vlohef9@corp.supernews.com>
Source record: 31736

When you load Atari cassettes - the sound is convertered into the 'basic program' Can't the emulators be programmed to input the same sound through a wav file (or mp3) Maybe my thought is way off - but I think it would be possible. Can someone explain one way or the other? Thanks.

All Commdores before the C64 had 6502 CPUs, and the only difference
between the two chips is that the 6510 has one on-chip parallel I/O port
hardwired to memory adresses 0 and 1. Otherwise they're identical.

You can convert cassettes to .cas files with a PC program I wrote.
All you need is an audio cassette player connected to a PC with sound
card and my software. If you do not have this yourself, surely you
can find a PC that has a sound card. The biggest problem is
converting the tape boot format to a cassette boot format. If the
program is simply a basic file, this would be easy. If it really is a
boot tape, you will have to write a disk boot loader or otherwise
convert the software manually. Anyway, E-mailing a .cas file to
someone that is willing to do this for you if you cannot do this
yourself is easier than mailing a cassette.
You can find my cassette stuff on my home page:
http://home.planet.nl/~ernest

Maybe the emulators will someday support the .cas format.
Keep those XL's/XE's buzzing.
Regards, Ernest.

Re: Re: Has anyone played Mercenary 2

> I never saw one, but that everything on one disk side almost sounds
> impossible...

I don't see why... the C= 64 1541 drive is a GCR. It is flexible enough to read the fixed sector length of the ATARI format. The ATARI would see any C= 64 data as "bad sectors". I don't see why it couldn't be done if it were set up intelligently....

There is an exceptional programmer named David Keil who has done this for the TRS-80 line of computers. It's a virtual cassette screen interface complete with play record rewind and fast forward. You can also plug a tape deck into your sound card and load a real tape into the emulator. I'm still surprised that no one has done this for the 8bits! Here's his link on the net and I think I'll email him with the 8bit suggestion.

It's probably so easy that no one has even thought to try it out yet. The biggest trick would be to get an RCA to SIO cable built, but even that should be trivial. You'd want to make sure that the .mp3 file was encoded with the highest quality setting possible. 128kbps with the hq setting should suffice (using l3enc professional). Otherwise, 192kbps would be ok for the normal quality. The high-frequency artifacting might confuse the A8's SIO interface at lower bitrates. The new mp3Pro codec might make it easier to encode tapes at 64kbps, but it remains to be seen how well it would perform. Still, I used to write to the cheapest tapes possible, and even multi-stage tapes like Zaxxon would work well, so the level of noise in the .mp3 "tape" shouldn't be too terrible to work with.

It's a neat theory, but in practice you may want to convert those tapes to disk images anyway, to speed up the load times.

Happy 8-bit'ing,
Steven

Atari's Basic was based on Shepardson's (sp?) Basic, a variant written in the mid-1970's. It did NOT use true string arrays, but instead used what we came to know and loath as pseudo-arrays. In some ways, pseudo-arrays were easier to comprehend, but in practice they were a little harder to implement. But that never stopped the talented programmer from writing extremely complex databases at the time.

Hi,

> so you were the guys who were doing the mysterious work
>for atari in the u.k.

LOL, both of us....which was a major part of the problem. :-(

>....julie wade once complained to me that you guys were
>late with some stuff, and that it was to late to release
>it....

I don't want to say too much in public, but there were reasons for the stuff being so late - feel free to email me if you want to know more.

I will say this though; when I was taken on to port "Jinks" to the 7800 it was already THREE MONTHS late being delivered (as I found out during a phone conversation with John Skruch).

> my queston to you is what did you guys do that atari did
>not release on the 7800, or the 8-bit?

AFAIK, between us, Bob and I worked on the following games:

"Tower Toppler" 7800 - completed
"Tower Toppler" 2600 - abandoned (no coding done)
"Tower Toppler" 8-bit - abandoned

"Jinks" 7800 - completed
"Jinks" 2600 - abandoned (no coding done)

"Deflektor" 7800 - abandoned
"Deflektor" 2600 - abandoned (no coding done)
"Deflektor" 8-bit - abandoned

I was to work on two more games for the 7800 (no 2600 or 8-bit ports were mooted). One was a conversion of a Hewson game called "Eliminator". I forget the name of the other game, but it involved you controlling a ship at the top of the screen from which you depth charged submarines, fish, mermaids, etc.

"Eliminator" never got past the planning stage, I believe we couldn't agree terms with Hewson.

The other game never got done because I left the company (quite frankly it was rubbish anyway) shortly after which, I believe, the deal with Atari fell through.

TTFN - Pete.

Hi,

> Well, then! How in the world did they do that?

Believe it or not it's not THAT difficult to do. The point is that it's a data disc rather than a bootable/DOS disc.

So, you simply format part of the disc in CBM GCR format (enough for CBM DOS to be able to recognise and use it) and the rest in Atari FM format (ISTR Paul used a Happy 810 to do this).

The CBM version of the game then simply requests the apt blocks from the drive, and the Atari version simply reads the appropriate tracks....

TTFN - Pete.

Was NorthStar Basic a derivation of Microsoft Basic? It was in very wide use on S100 machines back around 1980. I seem to remember that Byte Magazine published a lot of programs in it. Fortunately I had purchased a BASIC cross-reference that listed the variations in different flavors and could translate them all to Applesoft. Usually the biggest change required was IF-THEN statements, because Applesoft skips the entire line if it is false and pretty much all other Basics just skip the IF-THEN statement and execute the rest of the line.

> Was NorthStar Basic a derivation of Microsoft Basic?

No, NS BASIC was patterned after HP minicomputer BASIC. Example: There were no string arrays. DIM
A$(100) created a single string with a length of 100. MS BASIC was patterned after DEC BASIC (so
says Gates) in which DIM A$(100) created a table of 100 variable-length strings.

I have never seen these games myself, but the
subject is interesting and I made a quick
research.

There are indications on that the "Knight Orc"
game was released for the Atari 400/800/XL/XE
series:

http://zx-museum.org.ru/ftp/ftp.void.jump.org/pub/sinclair/games-info/k/Knig
htOrc.txt

Aaron,

I have never seen these games myself, but the
subject is interesting and I made a quick
research.

There are indications on that the "Knight Orc"
game was released for the Atari 400/800/XL/XE
series.

This link seems to be a copy of a loading
instructions document that came with the
Sinclair ZX Spectrum version of the game. The
instruction is generic in the sense that it covers
all formats, including the Atari:

http://zx-museum.org.ru/ftp/ftp.void.jump.org/pub/sinclair/games-info/k/Knig
htOrc.txt

Here is another link. The page is part of a web site
dedicated to adventure games. The "Knight Orc"
section mentions an Atari version:

http://www.if-legends.org/~adventure/Level_9_Computing.html#Knight_Orc

Unfortunately, I have not been able to find any
signs of an Atari version of Gnome Ranger.

Anders

Hi,

1) Is there any trick how to display GR.8 bitmap in color? I mean the pixels will have any color, but the background will be still back. Any trick (using PMG?)

2) If I set VDSLST ($200,$201) and VBLANK (LDA#6,JSR SETVBV), how should I restore them back? By some ROM call or just by remembering them before?

3) Is there any way how to get real ramtop? (When running from cart, ramtop will be lower than 48KB, but I want to know if machine is 48KB).

4) How to restore 'plain' gr.0 screen? Simply calling CIO open on channel 6?

Questions are really stupid, but I didn't write for Atari recently ;-)

548. make images from Tapes

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-20 22:48:01 UTC
From: FerFemNemBem <Jannn@T-Online.de>
Message-ID: <a2fhf2$pa9$06$1@news.t-online.com>
Source record: 31669

Hi,

today i get a lot af ATARI 800 Tapes from a friend.
My idea is to take images (like *.atr) from every of the tape because of
these tapes are very old.
I have the following:

- a good tape deck from Technics
- a ATARI 800XE
- a ATARO XC12
- a SIO2PC cable

Is there a possibility to record these tapes to the PC to take backups from
all these programs are recorded on the tapes?
Do i need any special Software?
Is there a possibility to see what programs are on these tapes?
He told me, that some of theses tapes are recorded with some kind of "speed
tools" for the XC12 Tape deck.... is there anything to pay attention to if i
like to backup theses "speeded up" tapes?

A lot of questions from a newbee with a bad english - but i don't like to
throw all these tapes out into the garbage...

Any suggestions would be appreciated!

Thank you.

FerFemNemBem

Source record: 31670

Depending on if they are system boot tapes or basic programs and data files.
You're best bet is to try loading them and then mark them once you figure
out what they are. Then using either basic to cload and then save "D:" or a
utility to read the tape and then write it to disk. Once the disk transfers
are done, there may be a need to modify the program so it will load data
from disk instead of tape. A little trick I learned is to use Atariwriter to
load and save basic data files.
If you need any help please let me know, I have a few cassette transfer
utilities on ATR if you need them as well.

> trick (using PMG?)

GR.8 is a one color two luminance mode, so you cannot separate them; you can pick any color in 710 and tweak brightness in 709 for best contrast or you might try mode 7+.

You could mass all of the players and missiles and map your image across any graphics screen, but resolution will be less than GR.8. Or set the massed PMG as a solid background color and adjust priorities for GR.8 image to display on top of them.

> 2) If I set VDSLST ($200,$201) and VBLANK (LDA#6,JSR SETVBV), how should
> I restore them back? By some ROM call or just by remembering them
> before?

The OS doesn't use DLIs, so just disable them or point it back to any RTI somewhere. Making any graphics call sets up a new display list with no DLI bits set. With enough study, you might find an OS routine in part of the warm or cold start code... much easier to save and restore.

I think you must save and restore the vertical blank vectors... Usually you end your VBI code with a JMP to the previous contents of the vectors so you have it saved; just restore it.

> 3) Is there any way to get real ramtop? (When running with a cart,
> ramtop will be lower than 48KB, but I want to know if machine is 48KB).

Can you just add the 8K or 16K for the cart to the value in 106? Or boot to Dos with no cart and do a binary Save of $6A with "K <ret>
D:RAMTOP,6A,6A<ret>"; then look at the file with:
O.#1,4,0,"D:RAMTOP":F.L=1TO7:GET#1,B:?B:N.L
You should get 255,255,106,0,106,0,192

Or boot TopDos with no cart and just display the memory; won't Sparta do this also?

> 4) How to restore 'plain' gr.0 screen? Simply calling CIO open on
> channel 6?

You could... but it is preferrable to open channel 0 to E: for read & write with aux1 set to 12.

Convert the tapes to audio samples then use the excellent WAV2CAS
to convert the FSK encoded data into a binary image.

Once you have a proper binary image you can go about either using it
as-is, or extract the program inside to a regular binary load file.

Steve

The souped-up XC12 was an Eastern European modification wasn't it? I
have heard stories how they got those things humming almost as fast as
disk drives. You are sort of in unknown waters... I like Steven
Tucker's suggestion to make WAV files. A WAV file you can tinker with
and send to people who can figure out what to do with it.

I hope you figure out a way to recover everything. I always say there
is unique code out there that gets lost every day.

No, this is a hardware limitation. You can tweak it a bit by using
PM-graphics: This will modify the graphics under the players as follows:

The background color is the color of the player, the foreground color
uses the hue (intensity) of the foreground pen, but the color of the player.
Hence, the player color "sort of" replaces the background color.

There is no way to display foreground graphics in a different color than the
background, this is a limitation of the GTIA.

> 2) If I set VDSLST ($200,$201) and VBLANK (LDA#6,JSR SETVBV), how should
> I restore them back? By some ROM call or just by remembering them
> before?

Just by keeping the old values. The Os doesn't require the DLIST (except
for smooth scrolling in graphics 0 introduced with the XL-Os). The VBI
itself is available as jump-entry somewhere in E4xx (sorry, forgot the
precise offset)

> 3) Is there any way how to get real ramtop? (When running from cart,

Check the address 0x6a (=106). It will contain the hi-word of the RAMTop.

> 4) How to restore 'plain' gr.0 screen? Simply calling CIO open on

For example. You could also close #0, and re-open it with the editor-device
"E:".

So long,

> I'll start shopping around anyhoo (starting with CO25953! ;).

That's a chip specially made for Atari. Your chances for finding that in a normal electronics store are worse then the chance on winning the biggest price in the lottery each week for a year.

You'll have to order these from B&C http://www.myatari.com or Best http://www.best-electronics-ca.com. I've never ordered from B&C. Best is OK, but expensive. Make sure you know what the shipping and handling costs (there is probably a list on their site, but I can't find it at the moment) BEFORE you order. I heard of somebody who cancelled the order when he heard of the shipping and handling cost. Best didn't like that and broke off all contact.

BTW get the catalog, even if you don't wanna order anything else from Best. It's like an Atari encyclopidia.

CU Mathy van Nisselroy

PS Best also has most of the other chips you need (the ones starting with 74)

557. Draining RAM, RAM-aid

Newsgroup: comp.sys.atari.8bit

Howdy folks

While browsing through some old ANTIC magazines, I came upon an article mentioning the RAM-Aid by Innovative Concepts (I.C.). Remember how you can't power cycle many 8 bit Atari machines without waiting for the RAMs to be drained? RAM-Aid was a solution to that. But it needed a switch and RESET to be held. (it worked on the testers XEGS with the 192kB RAM upgrade. I.C. had 2 memory upgrades for the XEGS. The first one added 64kB, the second added another 64kB. RAM-Aid worked great in 192kB mode, but seemed to have some problems in 128kB mode.)

Anybody know how RAM-Aid worked?

Maybe this could be a starting point for a 'drain all RAM while powers cycling' upgrade.

Howdy folks

(This message is cross-posted)

I've been hearing about upgrades for the 8 bit Atari and Commodore using the 65816 and am told the 65816 are getting rare. Then I read an article about the Atari Lynx using a 65C02 at 16MHz (I checked the net, seems like 3.6 MHz would have been closer to the truth.) and started thinking. Back when they still sold magazins about the Apple II gs, it was filled with upgrades using faster 6502's. IIRC they talked about 12MHz. And 6502 seem to be very popular still. IIRC the Apple II gs came with a 65618.

So my question is:

- Why is everybody using 65816's when 6502's seem to be better and more available?
- Are these faster 6502's really better then 65816's?
- How fast is todays fastest 6502?

Given that the typical 'relatively low' resolution on media player
these days would be something like 160x100x65000colours at 15fps,
it's highly unlikely that you'd be able to have any sort of decent
playback on an Atari8.

Given enough time you could downconvert a file to something
playable, but it'd be pretty ropey to say the least.

>Commodore and Atari disk systems are, and then watch the
>look on her face when I boot the same disk up in either
>system. 8-)

LOL, I can imagine.... :-)

It's been a *LONG* time since I messed around with CBM gear (I never really got into it that heavily....they were systems I HAD to use in the course of my work, rather than WANTED to use as in the case of Atari) but ISTR that due to the way CBM "DOS" stored the disc information, directory etc it's not too difficult to create dual boot discs.

As long as you have something like a "Happy" or "Archiver" in your 810 and a half decent disc editor for the CBM of course.

Did many companies create such dual boot discs, or was Novagen the only one?

TTFN - Pete.

MvN> and more available?

I'm not sure about availability, but the 65816 is the more capable
processor, as it has 16-bit registers and 24-bit address space.

MvN> - Are these faster 6502's really better then 65816's?

The fastest 65C02 I've seen is 8 MHz, the fastest 65816 I've seen runs
at 20 MHz (overclocked 16 MHz CPUs used in CMD's SuperCPU accelerators).

MvN> - How fast is todays fastest 6502?

8 Mhz is the fastest I've seen, but there are probably faster ones out
there.

Nope,
thats not impossible. Have quite some Mastertronic disks (and others)
here, that do the same. Atari uses the boot sectors, C64 does not. So,
all the sectors you can read on your Atari = the atari version, all
error sectors = C64 version. The finest thing on these disks is that
they do not contain any copy protection...

Well, I was thinking of (big) dealers here in europe, not private users.
Every Atarian was able to import it of course. But I do not know any
dealers (Ariola, US Gold, Rushware, Kingsoft, Joysoft, AMC, Ke-Soft,
Powersoft, Power per Post, ANG, etc.) that did import the R-Time-8 in
the 80`s or 90`s...

>
> You forgot about BiBo-Dos? :-)

I almost never use it - because a) the build-in version of the speedy
1050 Bibo-DOS is a shortened one (you should not save this version to
disk), b) the DUP Sys portion of Bibo-DOS uses RAM under the OS ROM...
and finally c) the DOS or DUP use Page 6!! (tested this with some Basic
files, that were using Page 6, they worked ok with DOS 2.0, Dos 2.5,
Turbo-DOS, etc. but not with Bibo-DOS; so it looks like Bibo-DOs is
using page 6 for whatever reason...)

> I actually only use it to get a directory from a disk if I didn't had
> Sparta-Dos started up, and this is only cause it loads quicker from the ROM of
> my 1050 Speedy compared to Turbo-Dos from my Turbo-Speedy :-)
>

Well, I once had a turbo-Speedy, but I did not like the "long(er)"
bootup time from the ROM, especially I hated that awful sound/noise the
floppy made when booting from ROM. My speedy 1050 has Bibo-DOS and
HSS-Copy-II build-in. But, since I never use bibo-dos, I did not install
a switch, but forced the floppy to always boot up the Copy program...

Source record: 31689

So,
1) I can get a 1MB ramdisk (P.Peterson style - US) from an ABBUC member. Since I do not know this RD at all, I am not sure how compatible it is and which programs will work with it (or which computer I will need to install it: 800/XL/XE/XEGS).

2) Maybe I can get a 1MB ramdisk (K.Peters style - GER) from Erhard Puetz, if he has one left or if he is building more of them. But I know, that this Ramdisk is awful and very incompatible to everything on the market !! Erhard once told me, that it would be possible to change this RD to be Newell compatible. But now, almost 3 years later, it looks like he still did not have the time to do the conversion or at least to build a Ramdisk (Its a shame, ABBUC has the rights to so many Compyshop things, but almost nothing - except the Speedy and the rests of the Bibomon are being sold).

3) Maybe TXG (Rene de Bie, dutch) is willing to build a 1MB ramdisk for me (and installing it into my computer, since I am absolutely unable to do it myself). But is his RD Newell compatible - or what else is it compatible to ?!?

4) maybe Mathy van Nisselroy (Dutch) is able to build a 1MB ramdisk for me. But at the moment his ramdisk (which seems to be the best one out there!) is only working on XEGS consoles/computers. Well, I do have 3 XE`s (eastern european ones, with 128k each, newest OS, Ramdisk test included, 32kbyte chips - 27128
x4) and 1 XL (equipped with a Compyshop Megaram-2 ramdisk, 256k extra ram).

Let`s wait and see how many years it will take, until I get a working 1MB ramdisk for one of my little Ataris. It would already be done, if I could build one myself, but unfortunately I am unable to do that, wahaaa... (crying like a baby). -Andreas.

Well,
another cool story in this topic:

AMC Verlag (Armin Stuermer and his programmers) once got the order from Rainbow Arts to program "Jinks" for the A8. Rainbow Arts itself got the order from Atari but gave it away to AMC for whatever reason. the AMC guys programmed a 32k or 48k version with many different sounds and levels. However, after a while Rainbow Arts told them they needed a 16k version, since it should be released on a non-bankswitching cart (why? no-one knows.) So the AMC guys removed a lot of levels and most of the sounds (except the title sound) and finally got the 16k version ready. I think in 1986 (or so) they did send this A8 version of Jinks to Rainbow Arts. But it never got published...

Many years later, around 1990, Armin Stuermer/AMC asked Rainbow Arts if they could get back the rights of their version of Jinks. Rainbow Arts agreed, but AMC/Armin Stuermer was forced to sell the A8 version only. Furthermore the A8 version should contain the name Rainbow Arts somewhere. So in 1991 the A8 version of Jinks was published as a disk based game (with approx 24kbytes of code, the rest of the older levels and sounds was never found again!) by AMC Verlag Germany. One can still read "Rainbow Arts" in the title picture of this game, although they did not do anything to program/release this game...
-Andreas.

Well,
since this GUI once appeared as a type-in listing in german Atari
magazin (and all Atari magazin disks, called Lazy Finger are PD) you can
get the type-in listing from me. the full and commercial version 2.0 is
avaiable from sascha roeber/Germany or Dean garaghty/UK. Thus, I do not
give away copies of the commercial version 2.0. But, afaik, the type-in
listing is almost as good as the commercial version and most of all it
is PD !! (Quick 1.0 also appeared as a type-in listing and thus is Pd
now!) -Andreas.

P.S.: As always, e-mail me, if you wanna have an ATR image...

Well,
a friend of a friend (ok, its a friend of Raimund Altmayer!) had an
Atari machine with a twice as fast CPU build-in. If I remember
correctly, ANTIC or GTIA or both run at approx. 3,6 Mhz, whereas the CPU
runs at approx. 1,8 Mhz. In an old german magazine and in the computer
of this "friend" both the CPU and graphic chip(s) were running with
3,6Mhz. He had a switch, so he could always switch back to the original
CPU (and original CPU speed).

With the fast 3,6MHz CPU turned on, a normal 1050 floppy ran almost as
fast as a Speedy or Happy - or at least it produced the same ultraspeed
sound (allthough it was a normal 1050 floppy, with no enhancements!).
Unfortunately, not all programs did run fine. Not only, that NONE of the
copy protected programs worked with this fast CPU, also quite some Pd
programs did not work alright or not at all. So, on one side a fast CPU
sounds fine, on the other side the compatibility problems does not sound
so fine. Damn, if I could only remember the name of this german magazin
which had the hardware enhancement printed (schematics and such). It was
a magazin around 1984-1986, so it is no wonder that I forgot about it...

Finally, I have not met this "friend" in the last 5 years. He is living
near Trier/Germany. Maybe you can ask Raimund Altmayer about him...
For all other Atarians: If you know more about the 3,6Mhz fast CPU or if
you know any magazin that has some info about it, let us know !!!
-Andreas.

>rare....
>....- Why is everybody using 65816's when 6502's seem to be
>better and more available?

Because the '816 is an upgraded 6502 with 16-bit registers and a larger (24-bit?) address space.

> - Are these faster 6502's really better then 65816's?

Depends on what you mean by "better".

They're simple plug in replacements for the slower 6502s and are 100% software compatible.

65816s have a different pinout and some software (OS in particular) needs to be patched to run on them. But they are much faster and have 16-bit capabilities.

> - How fast is todays fastest 6502?

Haven't looked for YEARS. Last time I checked they were up to 6MHz, but I wouldn't be at all surprised if there were 8MHz or even 10MHz parts available now.

TTFN - Pete.

Source record: 31597

Well,
let`s try 160x200 x 30 greys (HIP mode)... Wouldn`t that be enough ???
Ok, for example an uncompressed film/movie/ani with 25 pics per second (PAL) or 30 pics per second (NTSC) needs approx. 200kbytes (PAL) or approx. 240kbytes (NTSC); when we assume that every picture has approx. 8kbytes; HIP pics have approx 16kbytes...;

When we pack or compress these pics we could save disk/harddisk/ramdisk space, but then we have to unpack them again which takes (even more) time. If I remember correctly a harddisk can read approx. 30-50kbytes per second (really fast, compared to a floppy disk drive that reads approx. 2,4kbytes - 9,6kbytes per second), but still not enough or to slow for 200-240kbytes as listed in the example above...

So, we would have to "move down" the picture rate per second (25 pics/s. PAL, 30 pics/s. NTSC) to a lower level, maybe 1/6, 1/5, 1/4, 1/3 or 1/2 of the original rate. This may (???) cause some flicker or the pics would appear as pics and not as a film/movie/ani. But maybe it is possible to use some tricks then (as we all have seen them in earlier picture animations, like Max Headroom, Smurf, etc.) to fool the human eye to see it as an animation...

But still, I do not believe playback of a film/movie/ani is possible in realtime, because I think the little Atari is to slow for it. (Didn`t one need a double-speed CD-ROM at least to playback AVI/MOV/MPG/MP2 ?!? And Double-speed CD-ROMS have 300kbytes per second - far beyond the little Atari`s possibilities).
On the other hand, Animations, like the "BillPie"-Ani, the "Journey"-Ani (from Polynomials or Animkomials), the "Comet"-Ani (from MadTeam), the "Killerwhales" -Ani (also from MadTeam) and lots of other polish animations look pretty good, but they are not realtime animations (or movies or films)... -Andreas.

P.S.: Atari Harddisks are limited to 16MB partitions under MyDOS or SpartaDOS. Quite a lot of AVI/MOV/MPG/MP2 files I have today are a lot bigger than that. Future PC movies (in AVI/MOV/MPG/MP2 format, etc. on DVD) will surely not be limited to 320x200 pixels...

That is actually the TI ASIC core timing numbers. 166MHz is the
pre-layout number so
the actual ASIC would run slower, however TI now has the gs30 and gs40
processes, so
that would make it run faster. If you wanted to program an FPGA and
replace the 6502
in your Atari you could easily achieve 25MHz and possibly reaching a
clock speed of
60MHz or even faster.

Actually not a half bad idea.

> disk drives.

Maybe as fast as Commodore drives :) but not as fast as stock Atari
drives with their 19xxx Baud. These so-called TurboTapes load with
6000-7200 Baud (or maybe some dudes even managed more) by using some
hardware modifications built in. Schematics and software can be found at

http://www-user.tu-chemnitz.de/~sgl/atari/turb6000/turb6000.htm

> He told me, that some of theses tapes are recorded with some kind of "speed
> tools" for the XC12 Tape deck.... is there anything to pay attention to if i
> like to backup theses "speeded up" tapes?

Yes, this speeder for XC12 is a hardware modification added to the stock unit. In order to use it you need special software for I/O-handling. What you can use is "Schleife"-utilities or "Chaos"-utilities (loader, translator etc.) which should be preferred, because the Chaos tools allow to load files with size up to 59kByte (Turbo version of Strip Poker, for example).

More info and software:

http://www-user.tu-chemnitz.de/~sgl/atari/turb6000/turb6000.htm

The interesting with the Turbo-compatible software is that these programs are fully DOS 2.5 compatible (except for the size maybe, you need a picoDos or similiar to load). So everything was converted to DOS 2.5 format - there exist file versions of Koronis Rift, World Karate (all picture built in, no reloading during play!), and many many others...

Greets,

Andre

HipCrime offers a new service: Custom massive spamming, FREE.

Just post a URL to Free.HipCrime, and a "joe job" spam will be
conducted via both Usenet and Email. Your article will appear
in _every_ newsgroup (even moderated ones), and it is protected
from the filters and cancelbots by the latest in hash busting &
cancel preempting technology. Plus, your message will be sent
to many millions of emails (direct from closed, non-blacklisted
mail servers).

This will give you the best of both worlds: gigantic growth
in your site's traffic, combined with "plausible deniability"
with regards to any complaints.

Your site will become "internet famous" overnight, and a critical
mass of visitors will make it a "net hot spot" for years to come.

Got doubts? Just check with some of our happy customers, whose
traffic rates have recently shot through the roof, for example:

http://www.osearth.com
http://www.careermd.com
http://www.dolphinwave.org
http://www.spamhunter.co.uk
http://howardk.moonfall.com/
http://www.trance-formation.com
http://www.trance-formation.org
http://hometown.aol.com/frederi108
http://www.optional-identity.org.uk/
http://www.coollist.com/group.cgi?l=nntplist
http://www.hotboards.com/plus/plus.mirage?who=zodiac_16

HipCrime's ActiveAgent harvests email addresses by crawling the
World Wide Web (HTTP), scanning Usenet Newsgroups (NNTP), or by
loading compressed mega mailing lists (ZIP) like these:

http://64.227.13.120/here.zip
http://cyberspacereality.net/flamers/masterantis.zip
http://cyberspacereality.net/flamers/masterantis2.zip

HipCrime's ActiveAgent, the interNet's premier Publicity Engine,
is the integrated multi-protocol spamming solution, guaranteeing
anonymized saturation of both Usenet News (NNTP) and Email (SMTP).

Get your copy today, or get HipJoe'd ... it pays!

I don't know that I've ever heard of a 6502 nor 65C02 that could run that fast. Maybe if you overclocked an 8MHz 65C02...

Back when they still sold magazines about the Apple IIgs, and even today, it would be a *bad* idea to put a 6502 of *any* sort, into a II_gs_. The rest of the Apple II series in general, however, did accept the 6502, and many 6502 and 65816 boards have been developed for those other machines. There was even a logic-board upgrade that Apple offered to owners of the IIe that basically swapped out the motherboard and made the system into a IIgs. This is why many of the expansion cards developed "only for the IIgs" nonetheless have the slanted front corner, despite the regular IIgs case being nice and rectangular: some IIgs systems reside in IIe cases, and need the extra clearance. :)

I get the feeling that you mean, in the above, to simply say "Apple II." Am I right?

> And the 6502 seems to be very
> popular still. IIRC the Apple II gs came with a 65816.

That is correct.

> So my question is:
>
> - Why is everybody using 65816's when 6502's seem to be better and more
> available?

Because the 65816 is a 16-bit version of the 6502, and has a 24-bit address bus. Not to mention the fact that the 65816 seems to be capable of speeds up to 20MHz overclocked, 16MHz rated.

> - Are these faster 6502's really better than 65816's?

No, just faster. And the 65816 is capable of faster speeds, in general, than the 6502. It's like asking if a 16MHz 65816 is better than an 8MHz 68000. They both have 16-bit data busses, and 24-bit address busses, but the 68000 has lots more registers (32-bit ones at that), a more flexible stack pointer, and two operating modes (user and supervisor).

> - How fast is today's fastest 6502?

8MHz, as mentioned above -- and that's IIRC.

Anyway, the C64 is a bit too tightly integrated to accommodate much in the way of speed-up hardware hacks, unless you basically just make the "accelerator" essentially a self-contained computer that just uses the C64 as an I/O peripheral. This is pretty much what the SuperCPU 64/128 is. The Apple II is somewhat less integrated, and so it can accept such upgrades more easily. The Atari 8-bits? Hmm. It's not a good idea to think of them as all one group. That's like equating the VIC-20 with the 128, or the original II with the IIc+ (to remove the 65816 from the question momentarily). The 400/800 is different from the XLs, and the XLs are different from the XEs, all in subtle ways. Some of them may be more amenable to such hacks. Others may be too integrated, like the C64.

And then, there's the issue of compatibility. If you do manage to shoehorn a faster processor into your 6502-based vintage computer, what will happen to your software? Will it run? Will the speed-up make it unusable (key repeat, for example)?

At any rate, it makes the "roll-your-own" school of hardware hacking a bit involved for the machines of this era.

You may wish to check out:

http://www.westerndesigncenter.com/

There's a W65C02S clocked at 14MHz available, and a W65C816S clocked at
14MHz as well.

Datasheets, pinouts and such are also available.

Hope this helps,

David P

587. WTB:Knights of the Desert (SSI)

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-22 02:04:53 UTC
From: Steve Caupp <scaupp@one.net>
Message-ID: <cohp4uo4h2v1fedkdj11ec00e73r95bujn@4ax.com>
Source record: 31607

My early twenties (longer ago than I care to admit) were squandered on Avalon Hill and SPI war games. The greatest problem with these (as anyone familiar with them knows) was finding opponents with the time and inclination to play them. An automatic opponent was the biggest reason I got my first Atari way back when.

Stricken by strange nostalgia, I've been trying to recover every SSI game I ever had for my 8 bit Atari (not all of them, just the ones I personally had).

My two favorites were "Battle for Normandy" and "Knights of the Desert". "Battle for Normandy" seems to be very available, but I've never seen a single instance of "Knights" either as an honest to goodness boxed item or as a disk image.

The upshot: I'd be willing to pay good hard US currency for a working copy of "Knights of the Desert". The box would be nice but isn't necessary, the docs are (you can't play these things without the docs, no" F1" here).

I've vultured eBay for over a year with no sign of one. Heck, I'd even take a C64 version for the box and docs in case I come across an Atari disk-only or disk image later.

Any and all help appreciated. Thanks to all.

I'm looking for an 1050 atari disc drive, as mine has gone bad. If
anyone has a working one they'd like to sell, i'd be interested.
gimmie an email at kahbla@aol.com or reply to my post.
thanks!
matt

How quickly do you need it? I *will* have one for sale, but am currently using it to test my software (which will also be up for sale eventually). I'm going to put my cartridges up on Ebay on February 2nd. Then, I'll list my floppies, and finally my hardware. So, I don't forsee I'll have my hardware for sale before the end of February.

I'll be happy to e-mail you when I list it,

Robert Shaw

Blame it on my wife; I'm finally cleaning out the study. If there is any interest in a fairly complete set of Antic and Analog magazines, also Compute magazines which dealt with 8-bit Atari and other computers, Atari and 6502 programming books, an 800, an 800XL, a couple of monitors, a 1050 drive, and an Epson dot matrix printer connected through the 850 interface, let me know. I am in Pasadena, CA.

Hi,

my question: If i recorde this "SpeedTape" to an wav file, is it
possible for wav2cas to convert this file to an cas file or have i to
"slow down" the file simply with an wav editor to 600bps to convert it?

Thank you, Jan.

The answer is no, you cannot do this. The speedTape format is completely
different from the normal Atari format, because the file is one single
block. Waq2Cas will not understand the speedTape-format ;)

Hi Mo,

Since nobody else mentioned it in the recent atari tape threads I have
to
say that the most recent version of the Atari800 emulator includes a
cassette emulation in some 'beta' state. Since I don't have any .cas
files I couldn't check how good it already is but I think it's a good
reason for anyone who can do it to produce .cas files and try it out.

Well,
the fastest turbo tape drives I heard of, load with 9600 Baud - half of
the normal disk drive speed... And if I am counting right 9600 Baud
thats approx. 1,2 kbytes per second, whereas 19200 Baud thats approx.
2,4 kbytes per second. Not that pretty fast... (But on the other hand
600 Baud standard tape is much slower!) -Andreas

(P.S: counting 1 Baud as 1 Bit and 8 bit as 1 byte; thus we have to
divide the Baud rate by 8 and then by 1000 to get the approx. kbyte rate
- and by 1024 to get the exact kbyte rate - is that right ?!?)

I reread the message. He didn't cancel his order, he changed it. There was more then one part in it and he cancel the order for one of the heavier parts, but still wanted the rest. Best didn't like that and cancelled everything. Both were probably at fault. Best should not have cancelled everything and the guy ordering it should have asked Best what shipping would have been BEFORE he ordered it.

Howdy Dan

Just checked on your site if you have a ZIP. I see you have (as I seemed to remember).

Have you tried SCMON012 (also on the ASPI page), command 9 (IIRC)?
You'll have to press it twice or 3 times (depending on whether the disk has stopped already or not), but it will eject the ZIPdisk from the ZIPdrive.
(some devices ignore the first command after the medium has changed)

>
> 3) is it possible to create an OS that is compatible (to some extent) with
> the 400/800 OS, and includes the PBI drivers?
>
> -Dan

Well,
1) I personally know the Atari translator disk which comes as a boot disk with nice (random) gr.9 logos and boots only diskettes... but thats not a ROM; next there is the Ultra-translator from Tim ...Patrick (from Hawaii, The Happy Hacker!) avaiable as a ML file and as a cartridge from Video 61; so far it is the best translator I know, since it boots cassettes+disk+carts with or without basic !!
Ok, the cart version is not a ROM but an Eprom cart... So finally I also know the Bibomon 16k from Compyshop and Bibomon 24k from K. Peters (both german versions) which include an Atari 800 OS, an Atari XL Os and for whatever reason an Atari XE OS; you have to install this Bibomon into your computer, when you bootup a menu appears, where you can choose if you wanna load 800 or XL or XE OS and with Basic on or off (since I did not like this I gave my Bibomon Atari away, a long time ago...) besides you can also jump to the monitor program, which is only avaiable under the 800 OS...
(Well, reminds me of the Omnimon and equivalents...)

2) There are also alternative OS versions like SPOS (german) and QMEG OS (german) which are partly compatible with the 800 OS, i.e. most old games (cass., carts, disks) do not need the translator with these OS versions; - I personally have an exact copy of the 800 OS as an Eprom (uses 10k of the 16k Eprom) inside my Atari XL (a friend did the copy with an Eprom burner!), thus I only have to turn a switch to choose 800 or XL OS. For me this is the best solution and all I need. Ok, there are no speeders build in and no other comfort but therefore two original Atari OS versions and thus the highest compatibility...

Sometimes I use the switch to freeze a sound or a picture, i.e. turning the switch while the program is running - since no real freezer is avaiable the computer crashes, but the picture or sound often stays or keeps playing; I also use this to re-boot/coldstart from a reset proof or crashed program: program stays reset proof or crashed with XL OS - turn switch to 800 OS - turn back to XL OS - cold start happens

(sometimes I have to press RESET, but then a coldstart happens). This is surely no elegant way and maybe a bit risky, but my XL computer is still alive...

3) If you are a quite good hacker or programmer this would be possible, but no-one ever did it, I think (or is the S.O.S. and My-IDE from Sijmen Schouten just such a solution?)...

Greetings, andreas.

Ha,
looks like Jeff Potter is still alive...
Well, I still miss the SAVE functions in Degasview and IFF/LBM Read (to save any Degas, IFF or LBM graphic as a 62 sector a) Gr. 8, b) Gr. 9, c) Apac/Apac-2/Gr. 9+11 or d) Gr. 15 Atari picture). As said in an earlier e-mail, I would be willing to register these programs, especially if the Save feature would be integrated then. Unfortunately you "rejected" the registration and told me not to send any money, since you don`t use your Atari any longer (hidden in a corner or the cellar you said). thats very sad to hear - but since I read your posts from time to time: any chance you will ever come back and program something for the A8 again ?? Or create any updates of your own viewer / converter programs ?!?
-Andreas.

Others
> may be too integrated, like the C64.

They are basically one group. If software doesn't use illegal addresses, it
runs on all 8 bit Atari's be it the 400/800, the XL or the XE. They share
the same 'big chips' (as in, not the stuff you get from every electronics
store), which are at the same location for all the 8 bit Atari's.

Hallo Andreas, Gav, folks

The 296kB file needs 14 seconds.
The 164kB file needs 7 seconds.
The 192kB file needs 13 seconds.

That's not that fast. And what if it would really run at halve the speed?

With a bit of HIP or RIP, the Atari should be a able to keep up! OK, maybe
not in real time, but that wouldn't have to be a problem, as the Atari
probably isn't gonna be connected to the internet anyway.

In Czech Republic exists Turbo2000 and SuperTurbo (up to 6000 Bd).
I use it 10 years and I read my old tapes very well.
I use TTDOS, XL 256kB and QMEG OS. TTDOS is TurboTape DOS.
HW for XC-12 is very simply. I have any game (30 kB) about 3 minutes.
TTDOS has own block counter and I may create double block for write,
I use it for very important SW for me. Excuse me for bad english.
Fanny.

I too thought I'd seen it, even thought I have it in my collection, but when I looked yesterday I found out that I have both games only for the ST.

Not knowing all the details of this transaction I'll say this anyway:

That doesn't sound like a very good way to do business. If your
customer doesn't want to order certain items because of the shipping
cost and wants to change his order, then you change his order and
thank him for his business. A happy customer is a return customer.

Can you put one of these faster 6502s in the Atari? What about the
fact that the 6502 in the Atari has a halt line, can you get a 4Mhz
6502 with a halt line? I'd be willing to try it if it wasn't going to
blow up one of my computers.

From the little reading I've done about the 65816 it requires a
significant amount of hacking to get it to work as well as a
replacement OS to run it in native mode. Any English documentation on
a 65816 upgrade for the Atari 8-bit, anybody?

Halli, hallo!

Like some people know, I've tried to play video's on the ATARI8 some years ago, but I failed. The only video my ATARI8 played was a windsurfer. It was 64 x 48 pixels, 1 bit color (monochrome), an the frame rate was (depending on the RAM-Disk driver) between 15 and 25 fps. It was 5 sec long. I've played that video in Graphics 0 by using some font-tricks. Theese times, I've learned many things about video, compession, frame rate...and I can say, the ATARI8 is cannot play compressed videos. Think: if an ATARI8 needs nearly its full processing power to play a soundfile like WAV (formally known as SMP), so how can it be able to play videos?

Converting this "windsurf"-Video was easy: I've loaded it into Corel Photo Paint an reduced the size (to 64 x 48). Then I converted it into 1 bit monochrome. I saved it uncompressed. But this Video-File was 300 sectors big (SD). An ATARI8 with 128kB you can play that video (by using normal RAM an RAM-disk). Now think: a 10 sec video needs 600 sectors and a 20 sec video needs 1200 sectors. And the ATARI8 needs more and more RAM.

Mirko

Yes, but you can only run it at 3.785 mHz/2 like a normal Atari.

> What about the
> fact that the 6502 in the Atari has a halt line, can you get a 4Mhz
> 6502 with a halt line?

No, you can't get a normal 6502 with a halt line. What you can do is get a
really old Atari 800 that used the 6502B vs 6502C that was used in later
Atari 800 models and subsequent models through the XEs. You can also look at
a schematic of the Atari 800 CPU board from the Atari Home Computers
Technical Reference and one from the Atari 800XL and just look at the
missing glue chips you need to add. Not a lot, just one or two 74LSxxx chips
IIRC.

> I'd be willing to try it if it wasn't going to
> blow up one of my computers.

It won't blow it up. I have a 65C02 in my early 800. I have talked to
someone who has a 65802 in theirs. Thing is, you pretty much have a one of
kind machine that no one else will code for.

People have come out with 65816 replacements for the Atari, both Dataque<?>
and FTE. Neither of these were even a small sucess. The FTE was priced at
~$69 which seems damn reasonable to me but apparently wasn't to the bulk of
the Atari market.

My assessment was, it is a chicken and egg problem. Atari users are by and large a frugal lot, they need a reason for everything. No reason to spend $68 to put a 65816 in their system if it doesn't run faster or do something better. There never was a high level language on the platform that used the 65816 instruction set, so the market was limited to the 2% or so of the people willing to learn 65816 assembler. But then, why learn 65816 assembler if you are the only one that can use your resulting program?

So putting a faster 6502 in your atari is pointless in other words.

Yes, but now we are all collectors and old hardware hackers. Perhaps
some public domain high level languages could be patched to provide
code for the 65816 as well. I like to see cc65 assemble code for both
platforms.

I'd put a 65816 in one of my computers just for fun if I could find
some good English documents for it!

Ok i am french so excuse if my english if bad
i am new for artari emulation, i am use for oder emulation, sega, nes,n64.
ect.....

i have original Atari400 whit 30 Cartridge + 2 games for 410 cassette, my atari400 is not working well, so i try to play whit my PC , so i try Atari800WinPlus28 hey say some error or i dont understang some setup setting :(,

i only install Atari800WinPLus28.zip, atari_roms.zip

inside or my zip rom (atari_roms.zip)
atari5200.rom
ATARIBAS.ROM
ATARIOSB.ROM
ATARIXL.ROM

do i need more files or only those rom supose to work ?

i am planing to contruc web page for my personnalle Atari400 just for fun :), i will make so screenshot original book, info, i have all the stuff, i have the original boxe to play robotron :)

so if you can help me will bee fun !!!

Re the story Andreas told about Jinks: I agree. I spoke to Julian Eggebrecht
a few years back about Jinks and other games Rainbow Arts was commissioned
by Atari and the story was equally rediculous.

Anyway.

What really annoyed me at the time (1986) was that Lucasfilm decided NOT to
release the A8 version of Labyrinth. I understand that version was (nearly)
completed but was hidden somewhere at (nowadays) Lucas Arts. I was talking
to a lot of people about Labyrinth on the Atari over the years but it seems
impossible to get ahold of a copy, even after some 16 years!

Maybe we should issue some kind of petition. (-;
What do you think?

Frank

Western Design Center produces the 65c02 and 65c816 models, maximum
speed is rated at 14 mhz.

In supercpu is not a 16 mhz cpu, there IS a 14 mhz version. I have a
supercpu and checked its cpu. yes, 14 mhz. But I know that the cpu can
hold much higher speeds, due to cmos technology it uses. They produce
still processors.

WDC makes 14 mhz versions of 65c02.

Nearly completely so. MAC/65 cartrige from OSS/FTE supported the 65C02 instruction set. John Harris assembler MAE supports the 65802/65816 instruction set. We used to debate just how much more efficient the added instructions were. Low ball 65C02 estimates were usually around 5% reduction in code with the expected increase in speed from having to execute fewer instructions. I forgot what some of the high end estimates were, somewhere around 20% for specific examples were typical. 65802/65816 did much better, but then we are talking about $70 plus shipping to be 20-40% faster.

What should'a happened is maybe someone pester WDC to come out with a '65802C' with the halt line circuitry on chip. Then we would of had a direct replacement processor for the millions<?> of XL and XE series that were sold. Bit late now, I doubt if they would sell 20 of them. They don't even sell the 65802 anymore.
<snip>
> Yes, but now we are all collectors and old hardware hackers. Perhaps
> some public domain high level languages could be patched to provide

Actually you can if you go cross platform. I'm pretty sure there are free cross compilers for just about every processor written to work under Linux and I heard Wolfenstien 3d was developed on an Apple IIGS and ported to the SNES.

Almost everything has a IBM PC cross assembler for it now for cheap and quite a few have high level languages available.

I tried getting back into hardware hacking about a year ago and was pretty much crushed by the state of the art. Fifteen years ago I could walk in JDR and buy a wide assortment of Z80s, 1802s, 6502s, 808x, etcetera for $7-$20. Now I walk into the same place and it is the same exact processors for about the same prices. Nothing that has hit the market in the last 15 years other then a couple of PICs and Atmel 8031 clones has been added to the mix.

There were two DSP chips on the racks, AMD2085 or something and one from Lucent. The 2085 was pretty much the weakest in the line and obsolete while Lucent wanted ~$7,000 for their development package.

I phoned around to several manufacturers of DSP chips too, none of them bothered to return my calls. Hardware hacking has changed a lot. We should have 1 gHz 6502's that sip current available from the local convienence store.

Based on the new info I tend to agree, still I think buyers should be
aware that placing a firm order is a big step. When in doubt, ask for
a quote beforehand... in a few cases that I didn't (enticed by the
ease of online order), I got burnt surely enough - apparently the
seller (not any Atari dealer BTW) couldn't have cared less about the
difference between new and used.

OTOH I have sensed certain peculiar battle-hardenedness among Atari
dealers that I have done business with. Can't blame them really; they
must have been through lots of heat, serving the whole world with just
a few of them.

Well, that's about my 2 yen's worth (which ain't much these days 8).

p.s. Have done some homework; looks like Japanese IC's do carry the
same ID numbers after all :).

The wav2cas program works based on the fact that the mark and space
tone have a certain frequency. The turbo tapes use different
frequencies. The source code is included with my stuff, so anyone
that wants to try and adapt it is very welcome to try this.
I have never been able to find any documentation about the turbo tape
format or frequencies. I downloaded a MP3 file once, and it sounds
quite different. I do own a broken turbo unit, it is hard to buy
these in The Netherlands, and I do have a separate turbo box, but I
have not yet been able to get these to work in the first place, let
alone to try and convert these tapes too.
Time is limited, so I might not get around to doing this at all.
Slowing doen the file will probably not work, but you can try!

Keep those XL's/XE's humming.
Regards, Ernest.

P.S. for those that tried to download my programs, my provider had
some problem with the homepage server, but these problems are supposed
to be fixed now. Sorry about any inconvenience this may have caused.

Do you mean that you cannot make a WAV file or do you mean that you
cannot process them? Making a WAV file of about 100 megabytes
requires a fast PC, or you can use regular DOS.
Anyway, I record wav files regularly on my Pentium 133, and it works.
I do have 96 Mb memory though. I use wave studio from Creative labs.

Support for .cas files seems to be in the works, but if nobody writes
any feedback to authors, no enhancements will be made unless the
author feels like it. I receive very little feedback on my stuff, so
I suppose the same is true for other authors.

Keep those XL's/XE/s humming

Unfortunately, the link on the Polish homepage is broken.
Un*x is case sensitive when it comes to filenames, and the B is not
spelled in uppercase on the webpage, so it fails to load.
The proper url is:
http://atariarea.nostalgia.pl/PLus/files/Atari800WinPLus30Beta.zip

The broken link is on page

http://www.a800win.atari-area.prv.pl/

Both the Polish and the English version do not work unfortunately.
Keep those XL's/XE's humming.
Regards, Ernest.

I just tried out the 'Rainbow', an Atari 8-bit emulator for the PowerMac.
Really nice emulator that could do like the real Atari - amazes me!

It support DLI (display list interrupt) and also SMOOTH fine scrollings for
games, demos, etc. Only in real version - I DL'ed a demo version.

It will read ATR disk image format too! :o)

Not sure if anyone knows how to transfer binary codes (Atari EXE files) from
1050 drive to Mac's serial? probably needs special SIO2PC of some sort??

Anyone? Steve Tucker's modified APE software possible?

Well, just to add some more fuel to this, in a newer version of Page 6,
They review the 8bit version of 'Ingrids Back' by Level 9, again mentioning
about the previous releases of both Gnome Ranger and Knight Orc for the
Atari 8bit. In this review, there's a picture of the box for 'Ingrids back'
and
it clearly states for the Atari 8bit. :-)

They also review Lancelot as well, but for the ST, again mentioning though,
that
the 8bit version is available, although maybe only directly from Level 9,
who was
doing their own producing at this stage?

Again, If I get time to scan these two articles, I sure will...

So it certainly looks like they exist, just maybe didnt get many sales? Or
not widely
released?

Next on my list of 'Missing Adventure games' is 'Rick Hanson' from Robico
Software.
Originally for the BBS, but advertised fairly regularly throughout Page 6
mags.
Apparently they were also planning to release these games as well...
Enthar Seven
Island of Xaan
Project Thesius

Has anyone ever played these? or seen them? I expect Rick Hanson to exist,
but maybe
not the others?

Has anyone got the english version to this neat adventure? Like most people, I've only got the German version as a ATR.

I do have the english version on atari floppy, but It doenst work when I transfer it to ATR, Appears to have a couple of long tracks on 24/25 (hex). anyone have any tips on how to crack it? I can send the ATR dumps I do have of it to someone, if you want to try to crack it yourself.

It seems to load from these tracks just before you are prompted to enter the 2nd disk. But I'm out of my league trying to 'out fox' it.

Anyway, I'm certainly interested if someone has already transfered sucessfully the english version, or some help to crack it from my dumps..

Thanks

Aaron

637. Another Game with transfering probs. CYBORG

CYBORG, atari 8bit.
I havent seen this game anywhere on the web yet, thus am trying to transfer it from my Atari 8bit, Again, it seems to be copy protected, any volunteers to try to crack it? It's a little known text adventure game, on two Disks.

some Info available here...
http://www.if-legends.org/~yois/vault/sentient_cyborg.html

Again, just before it gets to the 'please flip the disk', the program appears to check for a bad sector, and as the ATR doesnt have it, it just locks up. Yes I probably could use a PRO format, but I prefer everything in ATR format.

Is PRO format supported by any emulators yet? That certainly would be a nice feature...

Thanks in advance again guys..

Aaron

I&#65533;d guess no one really gives a damn about those games at Lucasarts anymore.
I strongly doubt anyone of the early staff still works there.

What I was hoping for is that maybe the A8 version "leaked out" somehow. But even that seems highly doubtful given the previous experiences with Behind the Jaggi Lines a.k.a. Rescue on Fractalus, and Ballblaster a.k.a. Ballblazer.

that's not very usefull at all. It's better to programm a running
"video" as a demo. So it's even more interesting to see what our
little a8 can do in *realtime* with some nice msx.

currently, it would be more fascinating if the a8 scene could
reproduce some c64-only title like the ik+ project. It's today more
easy than ever. All we need is to rip soundz & 8-bit gfx of c64 and
programm it ourself. It sound easier as it is...but with enough
ambition, everything is possible.

as for the sounds / sid msx. I still can't believe, that nobody can
build a sap/sid-player for little atari?!?! It would be extremly cool
to have such a program!

I was refering to your own name. Your header says Kathleen, you call yourself atari8man. If I didn't have the impression your real name is guy, I'ld say Kathleen can never be the name of somebody calling himself atari8_MAN_

Just a small joke. There seem to be at least 3 guys who use a womans first name in there header.

What I am looking for is not something like the freezer. The freezer ads the ability to cold boot without powercycling. What I want is a power drain of ALL memory. Preferably one that works somewhere between the time you/I flip thze power switch to OFF and the moment voltage and current have REALLY dropped to zero.

Guus Assmann, back when we had an Atari user group in the Netherlands,
developed a PCB that would let you replace our 6502C for a 6502 (not sure is
that was 6502A, 6502B or 65C02, or if you could use all of them).

I guess if all 6502's (except for the 6502C) are pin compatible.....

(cyborg and lapis philosophorum)
whoa, there are some games I didn't know about.
The thing is about cracking, I never could understand, is how
someone can crack some disks that have data on non-standard sectors
from a .dcm (or .atr). I believe it can be done, but I never understood it.
I never was much of a cracker. I checked Black Patch and neither of
these games is on the list.
Just in case the protection involves data that must be retrieved from
non-standard sectors, making a PRO image might help. But then
you have to have a PRO cable and crack Steve Tucker's PRO format.

Yeah, my son confugured the email/newsgroups a few months ago and got the names wrong, Im to lazy at this point to change it. Im moving into a new house in a few week and will be off line for almost a month :(This may help you: About 10 years ago I was looking into away to drain the rams on a cold boot and was talking to a hardware hack in South Florida, he told me to cut the resistors next to the ram chip #@? I never gave it to much thought after I found " The Freezer" mod.

I know you probley have a black Box but do you also have the MIO? If so have you came across the problem of some XL/XE that work perfectly on the MIO but not on the black Box? This has been driving me wacky for years, I think it may have someting to do with the rejection rate at Atari on there chips, I was told this by the owner of CSS befor Bob Puff took over, He told me that when Atari tested there chips they would pass them even at 95% and that this was a problem for upgrades and hardware addons.

the really neat game by datamost is now finally available.
it is a 16k game that is pretty close to the original floppy version,
maybe just a little less color as you go thru the tunnel, otherwise it
looks about the same.
this game was always really fun for a early game, and i have been
playing it on my 400, as well as my xe.
thanks,
lance

I just sold the lot of mine on Ebay. It may be something the original poster might want to consider. I did pretty well on them:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1501747572

and a little better on the ANTIC lot:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1501744818

The last issue I owned was the September 1987 issue (number 57 or 75-I transposed one of the numbers in my auction). I don't know how long it went after that, but I pretty much stopped buying it since they were focusing more and more on the ST models - which I didn't own.

I also have a question. Which issue (can't remember if it was ANTIC, ANALOG, or something else) had the type-in program called "Doorstop". When ran, it was supposed to fry one of the chips in your ATARI making it basically only good for a doorstop. I remember it causing quite an outrage in both the letters to the magazines and also on the BBS's. It was sort of the first virus/trojan that I was aware of on the the ATARI. I remember people reanaming it and putting it up on the BBS's as games and others getting their computer trashed. Never got hit with it, but I DO remember seeing the program in one of the magazines. I tried to find it before I packaged up all my mags but never did.

The C-64 version was neat. I'd *love* to see a version for the Atari, if it
exists.
Has anyone ever asked the programmers involved with the 4 Atari/Lucasfilm
titles? They could probably confirm it, or possibly even have a copy of it.

>
> What I was hoping for is that maybe the A8 version "leaked out" somehow.
But

> Ballblazer.

Piracy for the C-64 was just as bad. I'd guess since the movie wasn't a
monster hit, and the C-64 version wasn't either, that's why the Atari
version was held back (if it was made).

Has anyone ever beaten this game (is it possible)? I beat Eidolon, but that game was cake compared to this. Beautiful game (visually), but practically impossible b/c of that saucer which would constantly attack. Most of the time you couldn't even see it to fire back. There was a "cheat" I used - you'd find a piece of equipment, immediately saving the game, and then restarting it, which would give you time to find another piece (before that damn saucer would show up). I remember at the final level there was a mountain range which completely surrounded you, and there wasn't anything to "do". I figured the game tired of my cheating and glitched out on me, so I never tried to start over.

654. One-chip SIO2PC OK for XE + 1050?

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-23 20:13:35 UTC
From: damfino@rochester.rr.com
Message-ID: <ef53b03c.0201231213.4fc83c08@posting.google.com>
Source record: 31575

My old SIO2PC PC hasn't worked in a couple years so I figured it was time to rebuild, and I'm trying to figure out if I need to built a one-chip or two-chip version... I want to be able to hook both my 130XE and my (modified) 1050 at the same time in order to be able to dump disks to .atr images. (I am a volunteer with TOSEC to rename 8bit ROMs and want to get as many as possible! Hopefully in a month or two a new TOSEC Atari 8bit db will be released, I'm trying to clean up the existing ones which someone else did.)

Anyways, it sounds like the 2-chip works better when connecting multiple drives, is the one-chip enough to do what I'm talking about though? I'm no electrical engineer so the simpler the better. :) Apparently I can't build a ProSystem cable as it requires a stock 1050, and much of what I'd be dumping would be double density...

Also, it sounds like, with the SIO2PC cable, the only way to make images is to do it from the Atari itself, is this correct? There's no PC-based utility to just dump images directly from the 1050?

I made the one chip version and haven't had any problems running APE
with a real 1050 hooked up as well. This was with an 800XL. YMMV.

>Also, it sounds like, with the SIO2PC cable, the only way to make

The 10502PC/Prosystem cable is different than the SIO2PC cable. With
an SIO2PC cable you can only hook up your computer (the PC acts as a
disk drive/modem/printer.) The 10502PC cable is for hooking your disk
drive to your computer and making images of your disks.

I have made a 10502PC cable but it didn't work for some reason.
Possibly the fact that I was trying to use my happy or I made a
mistake soldering. I really should go back to it and try some more.

Doorstop was a joke - a very well-done joke. Perhaps "hoax" would be a
better word.

I would run it whenever possible on folk's Ataris - it looked very
convincing, but was harmless. It would seem to do little or nothing,
then a few click sounds, a couple screen flickers, then more, then
more, until finally the screen just went to "snow" complete with white
noise. RESET was trapped so it'd take you right back to the snow after
the familiar blue screen was displayed for an instant. Turning the
Atari off and on (or using your cold-reset switch of choice) would get
you back working again.

The outrage was from people who were fooled by it - naturally, if you
think it's real, you won't actually run it and find it that it wasn't.
AFAIK it would be impossible for a software program to actually damage
the actual hardware of the Atari. (There was much discussion about the
possibility after Doorstop came out!)

There definitely was an A8 version. IIRC, Labyrinth was even programmed for
the Atari before it was ported to the other platforms. I may be wrong on
this one though, the coding could have been done simultaneously.

I have finished the games 3-4 time to the end, I got the games when it was
first released and it took awhile, I do remember that you need FULL Shields,
full power and just about full everthing just to play the last level.
The game has an ending.
But its been 14 or more years ago.

Good Luck.

Andreas Magenheimer wrote

: > : Since the Rtime8 clock (which Sparta uses) was not officially avaiable
: > : here in Europe,

: Well, I was thinking of (big) dealers here in europe, not private users.

That's right. But it WAS available :-)

: Well, at least the utilities that are avaiable for sparta should be
: avaiable for MyDOS as well...

Some Sparta-utils just can't be done in MyDOS, and vice-versa.

: > You forgot about BiBo-Dos? :-)
:
: I almost never use it - because a) the build-in version of the speedy
: 1050 Bibo-DOS is a shortened one (you should not save this version to
: disk),

You even can't save it to disk.

b) the DUP Sys portion of Bibo-DOS uses RAM under the OS ROM...

Only a small portion. TurboBASIC still runs with the Speedy-version.

: and finally c) the DOS or DUP use Page 6!! (tested this with some Basic
: files, that were using Page 6, they worked ok with DOS 2.0, Dos 2.5,
: Turbo-DOS, etc. but not with Bibo-DOS; so it looks like Bibo-DOs is
: using page 6 for whatever reason...)

I don't think it uses page6. A fact is that it uses a different way to acces
the diskdrives. The directly use the ROM routines so redirecting a drive# (as
possible on the Black-Box) doesn't work with any version of BiBo-Dos (except
one).

: Well, I once had a turbo-Speedy, but I did not like the "long(er)"
: bootup time from the ROM,

That why I use BiBo in stead. Loads quicker from ROM.

: especially I hated that awful sound/noise the
: floppy made when booting from ROM.

Can be disabled on the BlackBox (or by turning down your volume :-))

: My speedy 1050 has Bibo-DOS and
: HSS-Copy-II build-in. But, since I never use bibo-dos, I did not install
: a switch, but forced the floppy to always boot up the Copy program...

I use both, and since there already was a switch on the front, one more or less doesn't matter too much :-) HSS-copy is nice, especially when you have two Speedy drives. Extremely fast, and it formats the destination drive while reading the source-disk. Nifty solution to speed things up.

Ron Hamilton> wrote

: > 2) If I set VDSLST ($200,$201) and VBLANK (LDA#6,JSR SETVBV), how should
: > I restore them back? By some ROM call or just by remembering them
: > before?

: The OS doesn't use DLIs, so just disable them or point it back to any RTI
: somewhere. Making any graphics call sets up a new display list with no DLI
: bits set. With enough study, you might find an OS routine in part of the
: warm or cold start code... much easier to save and restore.

The way I restore those vectors (or about any other) is just by remembering
them. Something like:

```
lda $0200
pha
lda $0201
pha
; -------------
; code
; goes
; here
; -------------
; make sure code always exits here
pla
sta $0201
pla
sta $0200
rts
```

Another thing I do is erasing the last used keypress. It's annoying to see an
"X" showing up in DOS when pressed "X" to exit a program.

```
lda #$ff
sta $02f4
```

I would also recommend to make sure you've restored the colors you have used
in your code (if any) and to do a CLD if you used this opcode anywhere in your
program.

I don't see how anyone ever beats games like these. I remember playing
them. Both were graphically stunning at the time. Eidolon lost me with
the colors of all the flame balls. I think I completed 4 levels.
Koronis Rift was a bit more fun I found, and I recall the different
icons for the various technologies you could acquire. Fun stuff. But
the difficulty was a bit high!

667. APE cables

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-24 00:18:52 UTC
From: John McCulloch <mcculloch@accesstoledo.com>
Message-ID: <MpI38.81181$QB1.5766913@bin3.nnrp.aus1.giganews.com>
Source record: 31587

I have an SIO2PC cable which works great for disk access to the PC through APE for WinXP which I am beta-testing. But, I can't get it to to work for printer emulation to the PC. I'm using an 800XL and a PC with WinXP. Steven Tucker assures me that printer emulation works fine and I believe him, but in my case, it doesn't work. An APE cable design uses DSR instead of RI for the SIO command signal. I made a small cable which changes the pin 9 RI to the pin 6 DSR and it works great for disk access again, but no change in printer support.

At first Steven offered to send me a cable and if it worked I could buy it at a price that gave me sticker shock. After looking at all of the different designs out there, I realized that I could not try and make them all one by one and test them by the end of the next millenium and think now I've got to get a cable of the most robust design out there.

I think I truly pissed Steven off after his first offer and corresponding price for success, and he doesn't return my emails anymore. So, I need to know, what is the most robust design out there, such that it can be chained off a another Atari compatible drive (more specifically an Indus GT) and supports the DSR pin for SIO command.

I finally found an acceptable DOS and now want to get back into 6502 programming with MAC/65, but as you may all know, you can't do it efficiently without printing. Since I chose to use SpartaDOS, and since APE will not write to a PC mirrored file with SpartaDOS, I can't write to a PC and print that, and, even if I did, I'd have to write a VB program to replace the Atari eols to CR/LF. So the best thing is to get a cable that does APE disk access and printing.

To make an already way too long story short, who can sell me an APE cable that is as robust as they can possibly imagine, regardless of whether it is the one or two chip design?

Thanks,
John

John.
My homemade 1 chip APE cable isn't so hot either. It won't do
the 850 emulation of APE 1.17 (DOS), I'm sure it won't do the
printer thing either.
Instead of pulling your hair out about using APE to print thru to
your PC printer, you can just do an easy copy your Mac 65 source
to a MyDOS image, extract the file on the PC using 'imageman.exe'
for the PC, then translate the ATASCII to ASCII using (arhem)
my ATAS2ASC.EXE PC program, or somebody elses.
Then copy the resulting ASCII file to your PC printer.
I know you want to sit at your Atari and not get up and down
back and forth to the PC, but with this, you can start right away.
With getting a different cable, you're taking up your time.
Or try get the cable, but in the mean time, use a ATAS2ASC converter.
Mine are at my page, under the ASMED section, called
PCTRANS.ZIP there's a ATAS2ASC.EXE and ASC2ATAS.EXE.
There's also the same converters for your Atari.
Russg
There's also Bo Schreur's XDIR for the PC to extract files to
a PC directory named XIN, it works with any DOS I think, or
at least it works with SpartaDOS. I don't think it will extract
a single file, it extracts all the files on the disk to the PC.

674. ATR format incorrect

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-24 02:44:39 UTC
From: Kathleen Ferrante <KMFerrante@cfl.rr.com>
Message-ID: <ryK38.98077$_w.14203230@typhoon.tampabay.rr.com>
Source record: 31592

Has anybody ran cleanup.com on a 16 meg ART image?
It will trash your images. This leads me to think that the ATR format is incorrect. I have been using APE to make the 16 meg ATR files, Im wondering is there a util that will make a more stable ATR image?

675. Re: APE cables

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-24 02:57:18 UTC

If I were to also keep a MyDOS boot up to speed, I could use APE to write print files to PC files. I would probably then write a small Visual Basic program to convert the Atari printout to my networked printer. But, then again as you mention, there are other ways to do the necessary conversion to make the output printable.

As you know, if one is to do any real 8-bit programming, one must be able to print, not only what they are currently writing, but also other info that comes in the form of ATRs and the like.

At this point, I've had enough. I spent about a month and a half on getting a DOS that comes close to what I need. Then this comes up and I realize that APE and other attempts at accessory emulation are only for those that have the time to cascade printouts and other things through layer after layer of conversion programs to get what they need. The nostalgia in me has been properly extinguished.

Just to be perfectly clear, I did not offer to sell you a cable.

I offered to send you a test cable at my expense along with enough cash for
postage to return it after testing.

This was to help you debug your printing problem, not some sly attempt to score
a sale off you.

> I think I truly pissed Steven off after his first offer and corresponding
> price for success, and he doesn't return my emails anymore.

If I had any e-mail in my inbox from you I would be happy to answer it.

If you sent me something and didnt get a reply please send it again.

Probably just do what Russ suggested. If you don't have success with that,
there is also a really old conversion program 'TT' that would work.

You can always null modem to the PC and use Hyperterm/Bobterm to transfer
the files.

ProSystem will work fine with enhanced 1050 drives, in fact if you
have a Speedy 1050 upgrade it will read whole tracks at once to make
images faster.

What is cleanup.com? I doubt there is any problem with the image format
itself since its just a 16 byte header + a big blob of data.

The only problem with the Speedy 1050 I have is that the built-in DOS
software wont run on NTSC machines properly. The drive itself communicates fine
so as long as you dont want to use the built-in DOS for something, it works ok.

I actually have a PAL 800XL here I should try out the speedy with that
to see if it works =)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Hmm, don't you mean capacitors?
There should be a way to keep these working during powering up while
decreasing there influence during powering down. But how do we do that????

> I know you probley have a black Box but do you also have the MIO?

Sorry. I wanted a MIO, but they were expensive. Then the BlackBox came
along and I fell for that one.

> If so have you came across the problem of some XL/XE that work perfectly
on the

95%
> and that this was a problem for upgrades and hardware addons.

Who was the owner before Bob took over? Did Bob work for him?

I heard from Bob that there are:

- XL/XE's that work with MIO's but not BlackBoxes,
- XL/XE's that work with BlackBoxes but not MIO's,
- XL/XE's that work with both

And there are probably XL/XE's that work with neither.

There are two ways to solve this problem (other then searching for a
computer that will work with either/both):

- check you CPU and if it says made in Mexico, replace it.
- search for a file by Bob Puff called stabilizer XL (http://www.nleaudio.com/css/stabiliz.htm). But you better check the file, Bob sometimes uses the wrong pin numbers. I wrote a text about it, maybe I should put both on my site.

Howdy folks

I found this site http://www.hut.fi/Misc/Electronics/circuits/dacs.html via
comp.sys.cbm
It has some schematics for digital to analog audio. The lower ones seem to
be better then the eastern european upgrade called Covox. BTW on the site
Tommy speaks about compatibility to the Speech Thing by the american company
called Covox. Wasn't there a write in campain in ANTIC initiated by Covox
themselves to see if they should develope a version for the Atari 8 bit?

That brings back memories ... like you I found that there was
eventually a saucer that was nearly impossible to hit and like you I
tried saving the game and restarting..... and like you I eventually
ended up getting stuck that way! I think there was an auto targetting
system but it never seemed to work properly for me.

It was a great game in other respects though ... superb gfx and
sound and I loved the weapons modules idea (and the little TV screens
at the top of your screen!).

Did you notice that the robot back on your ship was the same as the
one from the famous walking robot demo?

Eidolon was also pretty good, and I did manage to eventually beat
it but only with the aid of maps that were published in a C64 Mag.

Yeah, from doing more research, I realize that the 1050-2-PC is
different than the Pro... I'm thinking I may try to build both an
SIO2PC and the 1050-2-PC, there are times where both would be handy...
I'm anxious both to dump files and to run programs off the PC,
especially since I did an S-Video cable last night and suddenly I can
actually see the Atari screen clearly, instead of just a bunch of fuzz
with the screen barely visible in the background! What a difference.

Hopefully APE will work with the UltraSpeed+ OS I've got now, I recall
the old-old version I used to use wouldn't support the highspeed IO
which was hacked into the OS... I'll find out soon enough! Assuming
everything works as I hope, I'll probably have to order a registered
copy soon... (On a sorta-related topic, is the demo of Imagic crippled
in any way other than the nag screen? It only converted about 25% of
the DCM and XFD files I threw at it, the rest I had to convert
manually with Atari800Win... I didn't use the old command-line
converters as I didn't want to lose the long filenames...)

Right you are... I forgot the name but not what it does. Surely
"Paperweight" can be found with a little bit of searching... I know
I've got it on an old floppy and probably in .atr format somewhere in
the collection... I'd be curious how well it runs under emulation, it
did some fairly fancy hardware tricks to create a convincing meltdown.

Thanks Mathy on the comformation XL/XE problem, I has a few voice chats with the prevous owner of CSS and I cant remember his name darn it was a long time ago, The last voice chat I had with Bob Puff was 4 years ago just to place an order for Mux replacement chip for backup computers. Also thanks for the BB pinouts the BB is working perfect again, I double check the my work with a multi-tester before powering it up :)

Yes you must save the game alot, death can just be 1 shot away, when you start a new map you take off as fast as you can to the closes hulk and take the part and beam up quick if not you can have 2 purple sausers on your tail. There was some clues in the manual to help on a few levels and after completing the game a few times I still could not find the damn clock...

I could never figure out the Eidolon, bouncing color balls and changing them to other colors? Strange game but I will finish it someday.

I have successfully (using MyDOS) written a print file to a "mirror" to generate a file on the PC. No problem there. Of course each line has a non-standard eol (I think $9B). I could easily write a very small VB program to replace each $9b with $0D,$0A. Just wish I didn't have to do any conversion, of my own devising or not.

Thanks for that, VERY interesting story.

>....However, after a while Rainbow Arts told them they needed
>a 16k version, since it should be released on a non-bankswitching
>cart (why? no-one knows.)....

Hmm, I got a right bollocking off Atari over the amount of ROM I used for the 7800 port....it was all a matter of cost (ROM costs substantially more than a floppy disc or cassette).

>....So in 1991 the A8 version of Jinks was published as a disk
>based game (with approx 24kbytes of code, the rest of the older
>levels and sounds was never found again!)....

That doesn't surprise me. When I came to do the 7800 port, Rainbow Arts were unable to provide us with either the source code or graphics from ANY of the versions they'd already released. :-(

This is one of the reasons the 7800 port is missing so much of the gameplay and levels of the C64 version - the main reason is lack of time, but that's another story.

BTW I did at one time have a copy of the utterly appalling (unreleased?) ST port....now THAT was a truly awful port....

Hi,

> I have Jinks for the Atari 8bit why isnt on your list?

Because I listed only the games which Bob and I were working on porting to the 2600 and 7800....we had nothing whatsoever to do with any other versions.

Though, as you can see, we abandoned all the 2600 ports as being unworkable.

TTFN - Pete.

Howdy folks

You know me, I don't often misuse this group. But this time I need your help.

There's a little girl of 8 years old who has a disease 3 doctors here from 3 different hospitals can even find a name for. That's how rare it is. The child behaves like she's 1 year old. Can't jump or run and has epileptic ceasures. If you know a doctor in Child and/or Brain diseases, please tell her/him to look at this site. http://www.lyvania.nl The main site is in English, but Dutch and German versions are available. The kids medical history is on the site as are testresults.

CU Mathy van Nisselroy

PS I don't know these folks, their desperate cry for help (the girl might die is no cure is found) was on the news yesterday.

These were images that were part of the current TOSEC "800XL - ROMs" collection. Most of the images are .atrs, a few are .dcms and .xfds and I was converting them to make it a purely .atr collection (also to eliminate some of the duplicates...) At this point I've converted them all (either via Imagic or Atari800Win) so I don't remember for sure which are which, but I do have plenty of non-TOSEC .dcms that I haven't converted yet - if you don't have the TOSEC collection for reference, I'll try to send some more that don't work.

Take a look at this:
http://trident.mcs.kent.edu/~clisowsk/8bit/atr1.html

Which is an exercept from the atari system ref. manual that explains
how to call CIO/XIO functions from assembly. I imagine it would be
very similiar.

There may even be some facility already programmed into cc65 for the
atari? I know the file i/o routines work.

When I have some more time I will try to write some sample code for
you (unless someone beats me to it....)

I've got a Trak AT D2 drive whose motor is getting weak. For some of my floppies, it can't spin it fast enough, though my Rana has no problems. I've cracked it open, and it looks like a standard IBM floppy mechanism. I tried putting in an old 360k floppy I had, but the drive won't spin. The busy light comes on but that's it. Looking at the original mechanism, it looks like they modified the drive by adding a wire from pin 2 of the floppy connector to one of the chips on the drive. Anyone know what this does?

Neil Shipp.

Here's another question... Radio Shack doesn't have the 1489/14C89 in stock anywhere, and it looks like if they did, it'd be the 1489, not the desired 14C89. They also don't carry the .1uF tantalum capacitor. I've called a couple other electronics stores locally (upstate New York) with no luck, ordering from JDR will cost over $15 when all is said and done (huge shipping charges!) and Jameco didn't have the .1 tantalum... does anyone know of somewhere to order the stuff that won't kill me on shipping, or does anyone have any spares? (I'm looking for two of each, I'm building both an SIO2PC and 1050-2-PC/Pro...) I'd don't mind paying a little for shipping, but when I'm ordering ~$1.50 worth of parts, I hate the idea of spending ten times that to have them shipped!

Thanks guys!

Hello again!

This is what David Fox had to say about Labyrinth:

Hi Jindroush and Frank,

Both of you had similar questions -- I got an email from both of you today about an Atari version of Labyrinth...

Sorry to disappoint you, but there never was one. By the time we decided to do this game, the Atari was on its way downhill, having been beaten in the marketplace by the C64. The last games we did for the Atari were Koronis Rift and The Eidolon. Atari sales weren't especially good for either (I'm pretty sure C64 sales for both were much better), and we saw the writing on the wall. (Even though the Atari was by far my personal favorite, and I still think it was a better machine.)

So when the Labyrinth game got the go ahead, it became the first Lucas game to lead on the C64. If it had been commercially successful, we might have done versions for other platforms. But the film didn't get great reviews, and without a strong push from the film, Activision (the publisher on this title) didn't do much to promote the game. I doubt it sold more than 25-30K copies, but don't quote me on that.

But, I'm very happy that Labyrinth has some fans! I always thought it was groundbreaking in many ways. I've never gotten any fan mail on it, so it's nice to know people like it. Is there a version on the Web that can be played on a PC emulator?

Happy Classic Gaming,

David

Have you checked that the drive's power supply is generating 5v and 12v?
I don't think Trak used high density drives, but pin 2 on the floppy
connector
usually selects high or low density. If the drive light is on constantly
that is usually a sign that the cable is connected wrong.

Hmmm...interesting link. I don't know what it's for. I was responding to the ad. I have no affiliation with B&C Computervision (www.myatari.com). I know them to be reputable as I've done business with them over the years (I used to live in the Bay Area).

I post the link as a response to BS Computers ads because of this page:
http://home.pacifier.com/~atari/auctions.htm
I have auctioned Atari material and I test mine what I sell quite rigoursly.
I think their characterization of auctions is self-serving and inaccurate.
I like to make sure people know they have an alternate choice in online Atari stores.

I don't have any problem with the occasional ad posted to the Atari newsgroups. It's a small community and I don't think it hurts the group to have ads every so often.

It should not be very complicated to do in text. Load the tokenized BASIC
program. LIST the program to the 'C:' device. Link the ATARI modem to the
PC modem. Load MyDOS on the ATARI. Startup the PC . Load a terminal program
and activate Receive ASCII File. Copy the 'C:' device to the 'R:' device
(MyDOS has no problem with this). The bytes on the cassette tape should be
copied across to the PC.

Yes, that's an option. Years ago I had a device called an APEface which worked very well. But, even if I could get a similar device again, it was a terminal device in that it had no pass-through. Thus I couldn't use it and the SIO2PC cable at the same time. Plus I'm limited on space.

Until I'm sure that I can't get APE to work, I've gotta give Steven the chance to make it work since he is sure that it should.

Source record: 31458

You do not mention what resources you have such as a disk drive, 410/1010 cassette, etc. Depending on your hardware, you may need to send those tapes to someone for conversion. It should be a simple matter to boot with DOS and then LOAD"C: or CLOAD followed by a SAVE"D:FILE1.BAS... and finally one of the transfer options such as null modem, SIO2PC, AtariDsk...

```
(everbody gonna jump on this one.)
Uhm. I dunno. (all from the READY prompt).
CLOAD
LOAD "C:"
or maybe even ENTER "C:" if you LISTed "C:"
Then.
SAVE "D2:MYFILE.BAS" assuming you have a disk drive
or APE or SIO2PC cable.
For use in the emulator, you have to load the .ATR file into it
and also the BASIC cart.

> I don't think Trak used high density drives, but pin 2 on the floppy
> connector
> usually selects high or low density.

ACK. I think density selection should not cause this problem.

I don't know the Trak drive, so this is just another guess:

If the original drive really was Shugart compatible, one thing to check
still could be the drive select (ID) jumpers on the disk drive:

Standard PC floppy drives are set to "drive 2" per default (I'm
sure you have also wondered why the "B" drive in a PC is connected
straight to the floppy controller whereas the cable for drive "A"
as several wires "twisted" - that's the reason).
Be sure the drive is jumpered to be "drive 1" - sometimes the jumpers
are labeled DS0..DS3, in this case set the drive to DS0. If in doubt,
just jumper the drive to the lowest available ID :-)

HTH,

Hias

Howdy Carmel

> will the black box and assoc. drivers be compatable with cdrw's and
> jazz drives, as I would like to see these devices used on my a8

The BlackBox is. The only problem I see with the Jazz drive is that it might have more RAM then you can access. You only have 96 partition available of 16 MB max. Hmmm, might work. 100x16MB is 1.6Gig minus 4 x 16MB is 48MB. A Jazz drive is 1GigaByte.

You shoudl be able to use a CDRW. But I wouldn't wanna burn a CD on the Atari. It would probably take hours. On a PC, if a CD is bad after you burn it, you throw it away and burn a new one. On an 8 bit Atari this would take ages.

CU Mathy van Nisselroy

BTW did you check out my site at
http://www-users.rwth-aachen.de/mathy.van_nisselroy ?

> "original 400/800 OS" roms for the xl/xe computers is the best.

CSS's UltraSpeedPlus OS also has the FIXXL translator built in. It can even copy the old OS to RAM, so software trying funny stuff will find the old OS in ROM and RAM. I never use it since I usually use the UltraSpeed Plus itself.

CU Mathy van Nisselroy

PS no docs on this one on the CSS site yet. But I've scanned them.

Just use any monolithic .1uf capacitor. Im sure radio shack has something
cheap in that area, a ceramic probably.

If all else fails just leave it out it will probably work anyway. The
non-cmos version
of the 1489 will probably work as well as long as your serial port isnt too
stingy with
the power.

Search for 'Atari classic font' in Google and you will come up with it in a
few places.
You can also download the ATS program at the URL below, its free and includes
one
of the same fonts.

There are truetype versions and bitmap versions out there.

(1489, 14c89, tantalum capacitor.)
My APE cable doesn't work the best. I had a 1489, and replaced
it with a 14c89, didn't seem to make any difference. I found
a yellow capacitor of the right value and used that.
I found the 1489 and 14c89 at a surplus/junk electronics place.
I'm sure upstate NY has an electronics place like that.

Have the NTSC-A, PAL-B and 1200XL Rev. 11 OS ROMs surfaced somewhere?

I beta-tested this OS (back when it was called "Bob's OS" - my XE's bristling with switches, hacks, etc, that Mr Puff installed way back when) and have the released version in my Atari currently, I'm pretty sure I have the documentation lying around somewhere... if you're interested, I can probably OCR it for you.

Well,
1 megabyte is enough space - but you have to load the movie/ani into the RD somehow. Using a floppy will take quarters (15 minutes or more), a harddisk still needs some minutes to do so. But: Displaying such a file lasts only a few seconds (except that someone puts in an endless-loop, which most polish programmers did not!) Now think: you need 10 minutes (or more) loading time for 10 seconds (or more) playback time, is that worth the effort ??? A8 Harddisk users do not want to wait such a long time for any program to load, otherwise they have the intention to use tape recorders... -Andreas.

Well,
which version do you use - the Amercican version from Epyx or the
European version from Activision ?!? Afaik Activision created buggy
european versions, by using a data sector for their copy protection.
This was printed in several magazines and they said, because of this bug
the game cannot be solved and you should look out for the US/Epyx
version instead. On the other hand, if you do have the US version, ask
someone else, since I do not know how to solve it...
-Andreas.

hmmm - that would explain a lot! This reminds me of another
incident where I bought Ultima IV from US Gold. I could _never_ win
any battles in the game, and I figured something must have been
wrong. When I wrote to US Gold about the problem they basically wrote
back and said I must just be a crap player (paraphrased!).

Some time later I saw an article in Page 6 magazine (or possibly
Atari User) that said that the manufacturers had used bad sector copy
protection but the discs didn't have the bad sectors due to a
duplicating screwup - This time I sent the disc back and demanded and
got a new, working, copy of the game.

OK, in these days of the internet we find out these things pretty
quickly, but back then you could be lumbered with a game that didn't
work. I'm really pissed off that I never got to play Koronis Rift
properly now ..... does the fault effect the emulated versions too?

Hmm, I'll somehow have to check this. (may take some time) But I guess it doesn't take 10 minutes.

But it's not a matter of how long at takes. It's just a matter of 'can it be done or not'. I can watch these movies on a PC at the university. But I'ld like to be able to do that at home. Or show it at an Atari meeting. Doesn't matter if it toke 12 hours to convert it from .MOV to HIP or even RIP format (see my site http://www-users.rwth-aachen.de/mathy.van_nisselroy/ for info on HIP and RIP format). Even if it to took four 8 bit Atari's hooked up together via the multilink interface that long. I'ld just like it if we could look at these movies on the Atari.

Have you seen the Sexual Experience Demo by BAT! It's a great demo, and I love that this is possible on the Atari. Yes, an adult video has more detail and takes longer. But I like that demo anyway.

Well,
there is no need for you to read them. Just ignore them, if you do not
like them. For me (sitting in Germany) they are of interest from time to
time, i.e. when reading something new (special offers, price reductions,
etc.) I visit his homepage and take a look at it. Sometimes I even order
something (or let some friends order something for me). After all, I am
happy that there are still some atari dealers/vendors left and why not
let them do some adverts ?!?
Especially why not let them do some adverts in the atari newsgroups ?!?
I personall don`t mind... -Andreas.

Source record: 31489

Well,
in general I know some 400/800 RAM expansions with up to 1 Megabyte.
Maybe bigger expansions are possible there, I do not know. for XL/XE
(and XEGS) there are also 1 Megabyte RAM expansions avaiable and if they
are provided with a second PIA chip even larger expansions of 4
Megabytes, 8 Megabytes, 16 megabytes (and up to 256 Megabytes if you you
are nuts, er if you like) are possible too.

The problem nowadays is to find someone who builds such RAM extensions
(for the public) and installs them into your computer... In the past
there were not so many programs avaiable for any kind of RAM expansion,
but this changed in the last 5-10 years. Since then more and more
programs (demos, games, tools, etc.) coming from eastern europe (and
sometimes even from the US) support extra ram or even need extra
ram... -Andreas.

> I'm sure upstate NY has an electronics place like that.

Well, I picked up a couple .1 capacitors, I don't remember the type
off the top of my head, but they were the only ones Radio Shack had,
and I was assured that they were monolithic, so I'll give them a try.

I'm using sockets for the chip so I'll try assembling the cable then
desolder the 1489 from my old-old SIO2PC cable and drop it in the
socket and see how it works... this would also allow me to swap the
1489 between the SIO2PC and the 1050-2-PC as needed. (I'm also
planning on using a 5-pin DIN connection for the SIO, so I'll be able
to make do with just the one cut-up SIO cable, and swap between the
boxes... that'll probably be later though, first thing is to try to
get a working 1050-to-PC. I completed the first release of the "Atari
8bit - Games - ATR" db for TOSEC (2,270 properly renamed so far!) so I
can take a break from that and work on other stuff now...) If it's
flaky I'll need to try some more to track down a 14C89...

Eventual plan is use the 1050-2-PC for all dumping, and the SIO2PC
hooked into a small junky laptop running APE (have to be Windows
version for long filenames) and have that hooked into the main TV for
game-playing...

The Fastchip that I wrote many years ago had problems with only a few programs (I think there was a text formatting program from Atari and a calculator program that both had bugs resulting in calling in the middle of instructions that I had to patch so they could run with the Fastchip, everything else I ever tested worked fine).

The Fastchip was used in Darek Mihocka's emulator and so far as I know it worked fine there as well.

Hi, does anyone know where I can find a power supply for an Atari XEGS?
I've checked Ebay, but no luck. Are there some other systems out there that
use the same type of cord?

I just recently found one at a thrift store and would love to get it up and
running.

Also, does anyone if the 2600/7800 cartridges work on the XEGS? What about
old 2600 joysticks on it?

Thank you

Yeah, that was it... I couldn't remember the name, which is probably the main reason I couldn't find it. I've already shipped out my magazines, so it's too late to take a look at it.

So, it was a pratical joke all the time? I was always pretty worried after it came out, and was always extremely careful downloading anything after that point.

Hello,

Check also http://www.strotmann.de/~highland/bib/bibindex.html

for some Manuals. I have also tons of materials in
PDF waiting to be sorted and put on a webpage.
Anyone volunteering. I can provide the webspace for free.

Hi

The XEGS is a cut down atari 65XE, it uses the power supply as the 400/800/
all XL and all XE machines.

It uses the same carts as the 8 bit computers, which are not the same as the
2600/7800 machines. They are smaller and have different wireing. You can
however use all 8 bit periferal like disk drive, cassette deck, printers
etc.

The joystick will be fine.

Have a look here for more details

http://www.landfield.com/faqs/atari-8-bit/faq/index.html

Should answer all the questions you could ever come up with.

looks like an ST Monitor

They did not work with 8 bits out of the box

If the pin-outs can be found you may be able to put together an adaptor cable. Maybe have a look at the ST FAQ (if there is one).

I Currently use a commodore 1084s with my 130XE and an Audio Din to 4 rca cable bought from maplins which works just fine. Looks like you have a bit of soldering to do :(

Hi!

Firstly: sorry for my English - i speak english not good :-(

I have an 130XE computer. I'd like use the computer as an universal
controller (by joystick port). The simple program is almost done (in asm).
I'm going to put the program to the Cartridge EPROM, but... I don't know how
the Cartridge is handled by AtariOS? What should I do with my program to
make an working cartridge, wchich be able to run after reset?

Does anybody know any fundamental rules connected with that?

Thank you in advance for any answers.

Piotr Pydych

> that is usually a sign that the cable is connected wrong.

Yup, I already ran into that where the Trak cable wasn't marked properly and the red wire doesn't indicate line 1 as you'd normally think. In that case the drive just spun constantly so I know it had power.

Looks like the Panasonic drive I'm trying to shoe-horn in is a little different. The drive select lines, motor enable B, and pin 4 map to drive enable 1 through 4 on the drive. I flipped a different jumper on the drive (mm-mx) and now the drive spins up when it's supposed to. I even booted from a dos disk with it.

Now if I can only get writes to work. It looks like the Trak drive thinks this mechanism is always write protected. After that... seeing if double density works...

Neil Shipp.

The joysticks are compatible and the 2600/7800 cartrs are not.

The 400/800/810/1050 all use a 9V AC power brick with 2 conductor circular plug. The XL and XE (and probably XEGS) use 5V DC thru a DIN 7 plug; the pinouts are on Thunderdome.

> the Cartridge is handled by AtariOS? What should I do with my program to
> make an working cartridge, wchich be able to run after reset?
>
> Does anybody know any fundamental rules connected with that?

A just looked it up in my docs:

* A cartridge uses memory from $8000-$BFFF. When using a 16k EPROM,
address 0 of the EPROM will be mapped to address $8000 in the Atari
memory space.

* The last 6 bytes ($BFFA-$BFFF) have to be set as follows:

$BFFA/$BFFB : starting address
$BFFC : must be 0
$BFFD : options (see below)
$BFFE/$BFFF : initialize address

The init routine must end with "RTS".

Here's the meaning of the "options" byte:

Bit0=0 don't boot PBI devices
Bit0=1 boot PBI devices

Bit2=0 only init cartdridge
Bit2=1 init and start cartridge

Bit7=0 standard cartridge
Bit7=1 "special" (diagnostic?) cartridge, init will be called
somewhere at the very beginning of coldstart

IIRC init is called somewhere in the middle of coldstart, and start
is called at the very end.

I've built a self-made cartridge some 10 or 15 years ago (actually I
did it just for fun :-) and I hope that this information is correct.

IIRC I didn't use the init-routine (I just pointed $BFFE/$BFFF to an
address in the cart containing a RTS-instruction) and just used the
start address.

HTH,

Hias

The 1200XL uses the same as the 400/800/810/1050 too as far as I know,
but some of the amp ratings are different, IIRC.

From: Brian <bfurbee@eastex.net>
Message-ID: <B%268.143$7W1.6746@eagle.america.net>
Source record: 31408

Greetings All!

I have the following equipment laying around gathering dust and am considering selling it.... if interested please contact me via e-mail as bfurbee@eastex.net

Atari 800XL w/ 256K RAMBO Upgrade (Working)
1 Atari 1050 Disk Drive w/ US Doubler (Working)
1 Atari XF551 Disk Drive (Working)
Atari SX212 Modem (Working)

ICD MIO w/ 1 MB (All works except the
serial port!)
Atari SH204 SCSI Hard Drive

ICD SpartaDOS X Cart
ICD R-Time-8 Cart (installed new battery 3 mos ago)

Commodore 1702 Color Monitor

Citizen GSX-130 24-pin Dot-Matrix Printer w/ Color Option Installed

Let me know if interested. I would rather sell the system complete than piece it out, but all offers will be considered.

Thanks,

Brian

If you want to run it all you need a XL or XE with 320k ram. Lots of the new demos by Madteam and other are 320k. The 320k upgrade is easy to do. There are a some 320k XL but are hard to locate the docs to do the upgrade. The 320k XE is the way to go and about 45 min work and about $ 20.oo in parts.

Ok, I tried running the drive as a slave unit to the original master and
everything works, double density formating, etc. etc. So there must be some
signal on the master drive that the Panasonic drive isn't putting out.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:

It's also not right because the 400/800 use a totally different
power supply (9 V AC) than the XL and XE.

795. FS [UK]: Atari 410 Program Recorder

Newsgroup: comp.sys.atari.8bit
Date: 2002-01-31 17:10:09 UTC
From: maiau@mbox.com.au
Message-ID: <443f57fa.0201310910.423f095d@posting.google.com>
Source record: 31416

Atari 410 Program Recorder.

To suit Atari 400/800 (600/800XL?).

In original box (no polys). However no manual or PSU, although it appears to take a fairly

standard 6V supply.

Some yellowing with age. No noticeable stratches or dents. I'd give it an 8 out of 10 for

overall condition. Please email me for pics or if you have any questions.

I'm asking a mere ï¿½5 plus postage...

UK enquiries preferred.

Cheers,

Mike.

796. FA:Ebay - Atari 8-bit carts

Hi,

All Electronics has a box full of Atari power bricks. dont remember
the price but they were kinda cheap I think. they do mail order to so
they should have a web site.

Ken

Source record: 31424

Howdy folks

I was walking through an electronics store when my eye fall on two remote controles for the PS2. Guess what, the one made by Sony mentioned that you had to copy the remote control handler/driver to some kind of memory card and it needed 2.2 MB. Yes, 2200 kilo Byte. For a remote control handler/driver!!!!

BTW the third party remote control didn't mention anything about memory.

Wow, 2.2 MegaByte just to remotely control your PS2.............

CU Mathy van Nisselroy

I think that some of the more fancy PC mice require something like
20-30 megs of HD space for a full driver install, and consume around
1-2 megs of RAM in operation.

Thats pretty scarey. OTOH memory and disk space is so cheap these
days, and development cycles so short, that its not economically
viable for developers to spend time optimising their software.

May be, the RC-Driver is written by peoples, who think, the system requieremements for an ATARI-joystick-driver are an 800MHz Pentium with 256MB (better more) memory... :-)

There maybe a way to have the Atari read the movie from a CD rom and just
dump it to the screen. I would not want to fill up my Atari HD with just 1
or 2 movies, but burn them in CD rom is better.
(streem movies on the 8bit)

Hi @ll,

I code a lot on my 130XE in the moment and I have 3 questions which could only be answered by experts like you ;-)

1. Is there a command in TB to delete a memory-part (size x) at adress y? I do that with the MOVE command in the moment (copying a ï¿½emty blockï¿½) is there a faster and smarter way to do this in TB?

2. Iï¿½m looking for a good GR.9 graphic-programm - does anyone know?

3. Is there a Atari-8Bit-Emu which runs in a 386 under Win 3.1 ???

809. Re: One-chip SIO2PC OK for XE + 1050?

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-01 17:38:01 UTC
From: damfino@rochester.rr.com
Message-ID: <ef53b03c.0202010938.5e231546@posting.google.com>
Source record: 31429

In case anyone's keeping track, I built the SIO2PC cable last night, and it worked first try, even working when using the R1 wire on the serial (the cable I was using didn't have a wire to the DSR) and having both a 1050 and the XE connected, so I was finally able to put some stuff onto the PC, including my fancy ATASCII-movie editor I wrote years and years ago... now to see if I can build a similar 1050-2-PC/Pro to make the images a little faster, and make some Pro images also...

I did discover that Ape 1.20 still does not work with the UltraSpeed+ OS's built-in UltraSpeed, the US+ OS queries it and then decides that there's no disk drive attached and goes into its self-test. There is a hotkey to turn off UltraSpeed from the OS, but I didn't remember what it was off the top of my head so I couldn't try it, but I'm pretty sure that'll work, as it works fine in XL or 800 mode. Either way, it does mean copying stuff to the PC is extraslow since most all my disks are formatted in ultraspeed mode, which is slower when ultraspeed isn't turned on...

810. Re: Media Player possible on Atari?

Newsgroup: comp.sys.atari.8bit

Message-ID: <3C5ADF39.30E70357@students.uni-mainz.de>
Source record: 31430

Well,
with a floppy speeder or a harddisk the loading time can be reduced
quite heavily. But not everyone has a harddisk (or a floppy speeder)...

Yes I know Sex.Exp. - it is just a Gr.9 demo/ani (not HIP!) - nice to
see but nothing brilliant so far (reminds me of those old pict.
animations, like Max Headroom, Smurf, etc.). Journey from the
Polynomials is much better, but it needs 320k RAM, uses 4 medium density
disk sides and most of all it does not have an endless loop, so after
some 8-10 seconds the great demo is over (and you have to load it
again). I am really wondering, how could they do such a big demo and
then forget a few bytes for the endless loop (the same counts for many
other polish demo coders). It would have been much better to show the
credits and greetings at the beginning and then showing the demo running
in an endless loop...

On the other hand I know a few good examples of such animations, like:
the BMW animation from M.Sobe (only Gr.6, low res. but nice!), the
Nascar animation by M.Sobe (also Gr.6 and low res. but still nice!), the
Comet demo by Madteam (Gr.9 with 16 blue-shades, looking great!), the
Killerwhale(s) demo by Madteam (another Gr.9 ani), Video Blitz by
Helvetica Bold (Gr. 7 or Gr. 15 ani), Shiny Bubbles by ??? (Gr. 7 or Gr.
15 ani) just to name some of them... -Andreas.

Move is OK, by deleting you say setting memory to "0",
you can use this code:

```
poke start,0
move start,start+1,count
```

This is the fastest TB MemoryFill I know (even a ASM
Routine should not any faster).
You can also fill memory with other values by changing the
poke command.

>

xformer, I guess (Plain DOS)
Atari800 (Plain DOS)

Ciao

Carsten

Seems there is nobody how knows ... I heard there is someone in poland
working at such a program ...

I am willing to trade items on my web page for carts. I don't have. I am
also looking for instructions & packaging for MULE and MicroLeague Baseball.
I am also open to all other offers.

Is there a util to sort a directory with mydos?
I need something that will do that.
Also looking for a little test editor that can handle mydos sub-dir's

Thanks

I always wanted a high speed Wafer tape trive for the Atari , do you
remember those type of drives?
The Sinclair and Coleco Adam had them.

>I did discover that Ape 1.20 still does not work with the UltraSpeed+ OS's built-in UltraSpeed, the US+ OS queries it and then decides that there's no disk drive attached and goes into its self-test. <

My registered version works great with the US+, including APE Warp 3X with 1 real Atari drive in the chain. (Two real drives has been "iffy" for me.) This applies to both my 14C89 and Max232 versions. UltraSpeed issues can and do occur when everything is not quite right. They typical occurs when reading from the PC AFTER writing to a real disk. If you are running the trial version, have you asked to see if US is partly disabled? It was in the Dos version, but I'm not sure about Win APE.

They were called "Stringy Floppies" for the TRS-80. Never had one but I
heard they could outperform a disk drive in those days and they were cheaper
too.

RECENT UPDATES
2002.01.20: Steven Tucker ATS 2.0 SR1
2002.01.20: added Pro! back to Video 61 (my error)
2002.01.20: Mike and Joe Fenton (ACE, WACKE, WAHCE)
2002.01.20: modified Derek Ledbetter entry
2002.01.20: Added entry for The MESS Team, MESS emulator for Mac
2002.01.20: Added WriteWtr to Matthias 'Hias' Reichl (HiassofT) entry
2002.01.20: Added "RECENT UPDATES" section (as suggested by Jindroush)

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
```

them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No product can be developed by more than one developer. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection. Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.
"Hi!" to Alex Martin, who has done the same for the land of Poland.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

820. Atari 8 bit stuff for free

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-03 00:06:31 UTC
From: Bruce Andrew <bandrew@adelphia.net>
Message-ID: <ba%68.626$nf.61498@news1.news.adelphia.net>
Source record: 31441

I have an 800, a souped up 130XE, Antic and Analog from 1985-1988, cartridges, games, a couple of 1050 drives, two tape drives, and many 8 bit books, including Atari Roots, also the entire program library of the Western New York Atari Users Group, more floppies than I care to think about, and if I really dig, also a printer. The only catch is that you have to come to my house in Niagara Falls, NY to get it.

Source record: 31442

Be careful with the "entire program library of the Western New York
Atari Users Groups" because a lot of that could be one-of-a-kind-last
remaining-copy type software.

I would be interested but it's a bit of a drive, maybe this spring...
someone will certainly take you up on this, you came to the right
place.

FamilyNet Newsgate

Re: Re: SpartaDOS experts

What I did for floppies... I didn't actually sort a directory, but I would use the TextPro "read directory" feature and collect all of my disk directories onto a master index floppy... sort of a "card catalog". I could sort the data records in any particular order or format that I wanted. I never touched the actual directories, but if you are dealing with a hard drive, you could sort the index records and then feed the sorted list to a batch macro that would copy files in sorted order to a virgin partition or something.

Hi ,

Ok the OS must be burned on a 28pin eprom not 16!
I like the MyIDE controller, Did he do a run on the interface? if so how much are they? .. anyways I looked that what needs to be done to make it and its quite easy compared to some of the other things I have build. I have no eprom burner so I would need to get this done from someone. I have a mint 130xe that will be upgraded to 576 before this Mod is done, I like Mydos and Sparta dos and Sparta is the way to go for easy operation but could live with mydos for this system. I would probley need a small (lap top size) IDE drive cause the HD will go inside the XE, I am wodering how much heat these little drives give off, would not want to melt the XE case or the Keyboard mylar. Im going to look into the other IDE devices but I will still build the MyIDE it looks great.

A sort would only work in the MyDos subdirectories or on large (greater than 720 sectors) disks where the file number bits are disabled unless you are willing to rewrite all of the file data sector link bytes.

TopDos 1.5 has a sort option built in, but I do not believe it supports subdirectories.

What exactly type of test editor are you needing? My revision of DiskMend by Justin Wilder has some capabilities for subdirectories and file traces.

825. FA (Ebay): ATARI 8-bit cartridges (some uncommon/rare)

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-03 06:12:29 UTC
From: bobbyshaw@aol.com
Message-ID: <20020203011229.28179.00001573@mb-ba.aol.com>
Source record: 31445

I have just put up approximately 30 auctions for all my ATARI 8-bit cartridges (and a Commodore and Nintendo cart I found). All have been tested and are working, and a few of these include the original manual. Several of these are listed as Uncommon and Rare on the 8-bit ATARI cartridge list. Below is a link to my auctions, and a list of every ATARI cartridge I have listed.

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?MfcISAPICommand=ViewListedItems&userid=bobbyshaw@aol.com

And heres the list:
Astro Chase
Atlantis
Basketball
Buck Rogers Planet of Zoom
Bug Hunt includes Light Gun
Caverns of Mars
Centipede
Computer Chess
Congo Bongo
Crossfire
Defender
Demon Attack
Donkey Kong
E.T. Phone Home!
Flight Simulator II
Gorf
James Bond 007
Missle Command
Pac-Man
Pole Position
Popeye
Q*bert
River Raid
Soccer
Space Invaders
Star Raiders
Super Breakout
Assembler Editor
Basic with 2 books

Thanks for looking!
Robert Shaw

Hello,

I have registered for the domain:

http://www.westfrontpc.tk/

This is a URL that points to my website at:

http://www.geocities.com/dunric/westfront.html

If you wish to play my game "Westfront PC: The Trials of Guilder"
(which is in the public domain), the above two addresses will work
fine. It is an IF-game available (also) at the Interactive Fiction
Archive, ZDNET, C|Net and other websites.

Also, I am working on translating the game to several different
platforms. I am looking for help in porting the game to:

Macintosh
Unix/Linux
BeOS
Amiga
Apple II/IIe
Atari 400/800
Atari 520ST
Commodore 64/128
Sinclair Spectrum ZX
DEC Rainbow

If you'd like to help, please write me at: dunric@yahoo.com

Regards,

Paul Panks (a/k/a "Dunric")

Message-ID: <a3m41dque1@nets3.rz.RWTH-Aachen.DE>
Source record: 31358

Howdy folks

I have a couple of questions:

If the multilink interface is used (not in a game), would it be possible that more then one computer starts sending data over the link or does the interface prevent this?

Is it even possible to prevent a computer from sending it's data over the SIO bus?

If it doesn't already do so, can the multilink interface be upgraded to do so (make sure only one computer can send data)?

Could the multilink be upgraded so that each computer could be 'switched off' of the net, eliminating the need to unplug a computer if you wanna use it for something else?

What happens, if data comes in over the SIO bus, while the computer is not expecting it?

Do I really have to unplug all my periferals when I want to use the multilink interface? (the docs to Multi DASH say so, but that might be to prevent the other computers from booting from disk instead of from the 'master' computer)

CU Mathy van Nisselroy

Hi Carsten !
Yep, it should be a programming language.
On the cassette cover is written:
* Basic dictionary is compatible with Fig Forth
* Complete set of I/O extensions
* Build-in editor definitions
* Atari Basic compatible graphics commands
* Automatic control of Atari Player Missile graphics
* Build-in sound commands
(and more ...)
ES_Forth should run with Atari 400/800 with 32K (and XL, of course)

I found the cassette cover on the Pooldisk 2 CD, so the program is
existing !

Greetings,
- Mr.Bacardi -

I just started transferring my old floppies to PC, and there on the
third disk was "Paperweight"... ran it on my 130XE, looks good but
quite harmless. I just tried it in Atari800Win 3.0beta and it was
emulated close to perfectly. I can upload it if anyone's interested
but haven't found it elsewhere (I realize this isn't a binaries group
but it's a pretty tiny program)...

840. VCS 7800 video pinout

Newsgroup: comp.sys.atari.8bit

Source record: 31362

I'm not sure this is the right place to ask, but I have a VCS 7800
with no video cable, so I'd like to build one myself and need the
pinout for the minidin video output of the VCS 7800 (French version,
if it makes any difference).

Sorry again if this is not the appropriate newsgroup

Thanks a lot!

Hi Mr. Bacardi,

do you have any information if ES_Forth has anything to do
with progrmming (e.g. Forth programming language). If yes, I'm
heavily interested in that.

Hey Mathy,

A few years ago at the MFACC meeting Jeff Poter brought his Multilink with
him, there was so much going on at the meeting we never got a chance to set
it up.
I always wonder if the Multikink could be used for other tham games. I on
the other hand have the Multiplexer from CSS that I use to run the BBS. but
the cost factor for the mux is a bit high for the everyday Atari user.
On the other hand the Multilink is easy to build and cost just a few bucks
this is what the everyday Atari user needs, but software must be wrote for
it to work as a server and someway to id all the other slaves I guess.

Hi Mo,

Yeah they where fast as hell, I had the Adam computer back in the 80's those little tapes spin like crazy, they where also looped and performed just like disk drives with dos. Now I have all hard drives on my Atari's but would still like a few of those high speed tape drives for the 8bit.

Any and all of the computers could be on the bus simultaneously. They
won't burn up their drivers (if you build the right interface), but
communication gets scrambled.

>Is it even possible to prevent a computer from sending it's data over the
>SIO bus?
>
Not that I remember.

>If it doesn't already do so, can the multilink interface be upgraded to do
>so (make sure only one computer can send data)?
>
I suppose that's possible, but you'd have to decide on a locking
mechanism (and what to do if the one locking it dies on you).

>Could the multilink be upgraded so that each computer could be 'switched
>off' of the net, eliminating the need to unplug a computer if you wanna use
>it for something else?
>
Also not too hard.

>What happens, if data comes in over the SIO bus, while the computer is not
>expecting it?
>
GameLink II was set up with interrupts, so at least one character makes
it through and into a buffer. If the computer still ignores it, the
first character is overwritten and a serial bus error occurs.

>Do I really have to unplug all my periferals when I want to use the
>multilink interface? (the docs to Multi DASH say so, but that might be to
>prevent the other computers from booting from disk instead of from the
>'master' computer)

>
Maybe I am answering the wrong questions. GameLink II allowed you to
leave other peripherals connected, but you risked having too long an SIO
chain.

Hmmm,
maybe TOMS navigator (a filemanager for MyDOS 4.5) sorts a directory -
haven`t tried it yet. Otherwise you may use any Basic/turbo-Basic/ML
program which has a sort routine to sort at least one directory (setup
D: as being the directory you want, thus any sort program which is able
to sort D:*.* files should do it). Well, most text editors which run
fine under MyDOS support MyDOS subdirs don`t they ?!? If not, try
Textpro 4.x or 5.x they should do the job... -andreas.

Well,
you can convert Waves to Tape and vice versa, but not in high/turbo
speed - at least not yet. Even the supercharger of the VCS (which
accepts Waves as digital data) does only normal speed... -Andreas.

Well,
here in europe, ABBUC (Germany) or maybe Sijmen Schouten himself (Netherlands) will burn an eprom for you... In the US, I think Best, B & C and maybe others will do it also, just ask them. -Andreas.

I'm using T:Edit by Analog computing. As long as the path doesn't get too long, you can use subdirs, as I do. Unfortunately, it only handles drives 1-4 and 8. But it can handle files up to 32kB approx.

In England, Frontier imported it and I'm sure there were German companies
that imported it too.
The biggest problem with imports from the USA (especially in the UK and
Germany) was that prices that weren't small to begin with turned huge as
soon as a company imported it.

The multiplexer no only is expensive, it also doesn't really look nice and sticks out way to much for my taste. Plus you need the multiplexer OS (read: no other non-standard OS). And it slows down communication to the harddrive, even if the multiplexer isn't used.

The MultiLink (an 'improved' version of the Gamelink II) just uses two wires to connect to the next computer. The Frankfurter hardware guys (a regional group of the German ABBUC) http://www.abbuc-raf.de/restarte.htm (in English, German version is also available) are selling a version that uses RCA jacks (the kind of plugs used in stereo's to connect the components together).

I wrote the message with the questions after I did a search on RS485 networks using Google and found a schematic involving RS485 which used only 2 wires. Just like the multilink interface.

Some logic could just disconnect the data out wire. Which would prevent the
scrambling mentioned above.

The first to access the bus locks up the bus.

You're answering the right ones, don't worry.

Here's another one. What happens when dat is being send? I mean, how much
handshaking is done/needed between the receiving and the sending party?

I wish I had a MUX. I probably only need one since it's not that hard to
build your own version inside an Atari in stead of using a cartridge. Anyone
has the schematics of it? Don't know if the ROM is available somewhere on the
net...

In GameLink II (and Maze of Agdagon) each computer grabs the bus in its assigned time slot as directed by the Host. It transmits its packet (4 words I thought?) and gets off the bus. It assumes all others received this packet (there is no per-word or per-packet handshake). The data is sent redundantly, so it's somewhat transmission error-tolerant (the Ataris couldn't update every frame time, so there's time to resend packets).

Source record: 31378

I've just bought an Atari 800XL as a bare console, no cartridge, datasette, floppies and power unit so i'd like to expand it a bit (not so much, just for using it). So here's some question:

1. I haven't original power supply, so i've to adapt one from, for example, a c64. XL800 needs 1.5 Amps, 9V and 7.5 W, as i've readed...is it right? Have i to know other specifications before?

2. I'de like to build SIO2PC cable, but there are two little problems: i can't find SIO connector to buy and...schematics are really fuzzy! Do u know about some - more clear - scheme to follow?

3. Finally I'm dreaming on myIDE interface. I've bought a 2.5 HDD and it fits perfectly into atari's chassis so i've decided to build internal version. Because i often hear about ide interfaces that wont' work so better (such as alot of c64's ones) i'de like to know if it works better and if it is affidable

sorry for dummy questions...tnx a lot
(sorry also for my bad english)

Aha. And how much handshaking is done/needed for just about everything else
(when there are no assigned time slots)? When we're not playing games, but
exchanging data with disk drives and interfaces?

I'm just curious.

864. Ten Trivia Questions (SIO2PC, ST vs Falcon,CD/ Zip)

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-06 14:11:26 UTC
From: Mike Stepansky <design3d@2-scale.com>
Message-ID: <B886A3BE.1FC9%design3d@2-scale.com>
Source record: 31382

Ten Trivia Questions:

1) Is there such a thing as a commercial version of SIO2PC? (I can't remember if ICD is the company name that used to sell SIO2PC, isn't it? I want to order one - not to built it!)

2) Curiously, is there another software similiar to APE that will allow me to transfer Atari binary (EXE) files between the 1050 drive (with 800XL) to a PC? Otherwise, I don't have a choice except to buy APE software and SIO2PC cable.

3) What does SIO2PC really look like? (jpeg)

4) What is the CPU/RAM specs for the Falcon? (Im confused: is it only 030 or 040 or maybe it is both options?)

5) Who still sells MegaST and Falcon and also CD-RW drive for it? (beside myatari.com/B&C Computervision dealer and beside ebay)

6) Is it possible to use Zip drive for the MegaST/Falcon? (scsi or parallel?)

7) How many Falcon-based games and Falcon-based 'graphic' demos are available for the Falcon (roughly)? (it would be nice if you could tell us the name of the FTP site that might have ST/Falcon "cool" graphics demos)

8) Are ST games compatible with the Falcon? If so, what percentage? If not, why not? (knowing that will allow me to decide to order MegaST4 as the high-end ST system rather than Falcon).

10) What is the standard graphics mode (color bit planes as well) for the Falcon?

That's about all. Thank you. My goal is to start dusting off 800XL so I can transfer my software/documents to the PC via SIO2PC cable. And then will go on to ST after that.

Nick Kennedy's SIO2PC software which is shareware. If you have an SIO2PC
cable, you are supposed to be able to use the RVerter handler with it to do
RS232 type transfers using terminal programs. I think there is a freeware
Linux SIO2PC software too.
>
> 3) What does SIO2PC really look like? (jpeg)

No two are alike. The eBay link is one built into the cable hood. If I put
one together, whatever box about the size of a cassette tape I have laying
around gets used.

Falcon questions, I know nothing about. Never went beyond a 1040 STfm before
I gave up on the Tramiel Atari.

Wrong on the power supply; 400/800 are 9V AC - the 800XL and 130XE are 5V DC
and the pinouts are on Thunderdome:
http://www7.ewebcity.com/atari/

The SIO end of the cable can be built-in to the XL connecting to traces
behind the 13 pin jack; once again, the pinouts are on Thunderdome.

Well, maybe my description wasn't very good. We had the Host (the one the others boot from) running from interrupts timed twice a frame time (one at VBlank, another midway down from a DLI). Each time the Host would grab the bus and direct another client to answer back with his packet (as soon as the Host gets off the bus). So the client would turn around and send his packet and get off the bus. I did it this way so the Host would just figure out to skip those clients that had gone away. The timing was pretty good, as no client ever overrun his time slot, from my testing.

Since Agdagon never had to exchange data with disk drives and so forth, I never worried about collisions. So an enhanced GameLink better take that into account, with handshaking or lockouts. You might study other networking standards like UDP, TCP/IP, etc. for insight.

I had one of those 1000e's myself. Made a little relay box to hook into
SIO. Added a couple of POKEs to turn ON/OFF cassette motor, which toggled a
relay in the phone line... voila! Caller Disconnected!!

> that into account, with handshaking or lockouts. You might study other
> networking standards like UDP, TCP/IP, etc. for insight.

I'ld first like to know what the Atari does SIO wise. Different networks are nice, but I wanna know first and formost what the Atari needs/wants/expects and what happens if something happens that is not needed/wanted or expected. If I know that I can look at standard networks. But whatever is connected to the Atari will at one time or another have to talk to the Atari.

> 1) Is there such a thing as a commercial version of SIO2PC? (I can't
> remember if ICD is the company name that used to sell SIO2PC, isn't it? I
> want to order one - not to built it!)
I believe there was, once upon a time, but I've never actually seen
it.

> 2) Curiously, is there another software similiar to APE that will allow me
> to transfer Atari binary (EXE) files between the 1050 drive (with 800XL) to
> a PC? Otherwise, I don't have a choice except to buy APE software and
> SIO2PC cable.
Well, yes there is. It's called xmodem. If you can somehow email
yourself some files, you can get them onto the PC. I know 8-bits can
use BBSs, so it's a possibility.

> 4) What is the CPU/RAM specs for the Falcon? (Im confused: is it only 030
> or 040 or maybe it is both options?)
Out of the box, its a 68030@16Mhz with 1 (useless), 4, or 14 Mb of
RAM. Higher speeds, RAM amounts, and CPUs exist by modifying the
Falcon.

> 5) Who still sells MegaST and Falcon and also CD-RW drive for it? (beside
> myatari.com/B&C Computervision dealer and beside ebay)
Best Electronics probably does. Note that these are 6-10 year old
machines, and most will be found on the used market.

> 6) Is it possible to use Zip drive for the MegaST/Falcon? (scsi or
> parallel?)
Yes for SCSI. Possibly even for IDE, though I'm not certain it would
work.

> 8) Are ST games compatible with the Falcon? If so, what percentage? If
> not, why not? (knowing that will allow me to decide to order MegaST4 as the
> high-end ST system rather than Falcon).
I'd say about 1/3 can be run out of the box, though most require that
you switch to 320x200x16 (ST Low) resolution) first. Another 1/3 can
be made to run by switching off your TSR software (the AUTO folder)
and using a program called BACKWARDS that makes the Falcon more
closely respond as an ST would.
Roughly 1/3 of games designed for the ST cannot be used at all on a
Falcon. About 90% of non-game software (and nearly anything made in
the 1990s) will run on the Falcon. I personally recommend keeping a
$25 ST for a dedicated games unit.

> 10) What is the standard graphics mode (color bit planes as well) for the
> Falcon?
The Falcon can change its graphics modes. It allows for ST
Low/Med/High as well as 640x480 in 2/4/16/256 colors and 320/240 in
16bit.. With a bit of software, 800x600x256 can be managed, though
the refresh rate drops to around 50 Hz, thus allowing some flicker.
With hardware, the graphics can be boosted. (Note: The Falcon slows
down as the graphics improve. I usually use 640x480x16, and I can
tell when I change to 640x480x256.)

878. Are atari 8-bits unrepairable?!?

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-08 02:52:30 UTC
From: Kate Slaminko <krslam@netscape.net>
Message-ID: <3C633D6E.361B6321@netscape.net>
Source record: 31248

I posted some time ago about some defective computers and drives that I had, asking for repair info. I got not 1 single reply, so I guess the message is that these things aren't repairable?

For the record, the problems are:
800 - several keys don't register and cleaning didn't help.
800XL - works OK but only in black and white.
600XL, 800XL, 1200XL, 130XE - only sign of life is the power indicator.
810 & 1050 drives - "boot error" message.

I really hate the idea of putting these in a landfill, but if I can't get them fixed....
-Ron

Source record: 31249

The 800 try pulling the keycaps and swabbing the contacts with isopropyl alcohol, work them insanely until you get results. The 600,800,1200,130 might be the power supplies you're using- not the computers themselves. Make sure you have the right power supplies (refer to the FAQ) and test the pins with a voltmeter (cheap from walmart or radio shack). The 810 and 1050 check the power supplies again, make sure both motors are spinning, swab the heads clean with alcohol if none of that works try opening the cases and plugging them up, being sure they are set to drive one (one at a time). Use trial and error adjusting the parking sensor and booting the drive. Just a hair at a time until you get a boot. The sensor is about the only thing you can adjust on the rails. If none of this helps, offer them up here or on Ebay for parts for sale. 8-)

With the bad 800XL and the good one (at least in B & W), you could try swapping chips until you see a change. Start with the largest chips. I've fixed many machines this way. Then, once you've identified the bad chip you can order a new one from B & C. I usually just pick the worst Atari I can find (at my house its an old corroded 600XL), and declare it the "spare parts machine". Also, for the B & W only 800XL, it just may be your video cable. The stock 800XL does not have a chroma line if you are trying for separate chroma/luma as in an S-Video output. Composite video will work, as will RF through a TV.

It is possible that the keys/contacts no longer work. It is possible with an ohmmeter to test the edge contacts to check key closure. A keyboard schematic is useful.

> 800XL - works OK but only in black and white.

> BW in both monitor and RF modes? Check GTIA(reseat), check RF

>
> 600XL, 800XL, 1200XL, 130XE - only sign of life is the power indicator.

Check with different power supplies. Reseat all chips. Does screen go blank? Check ram, cpu, gtia. After this, probably need a scope.

>
> 810 & 1050 drives - "boot error" message.
>

Set to #1? Clean heads with swab(lower head only, upper is pad-keep dry), or DAMP head cleaner disk. Reseat chips.

Gamelink II(multilink) uses 3 wires in the simplest of modes. Two wires has been the standard when using buffer chips. RCA phono connectors came along soom after.

GL II was designed using the method Atari set up with SIO. The host computer does all of the asking, all of the peripherals on the chain only respond to requests from the host, normally they don't initiate unless special driver software is installed. Using concurrent i/o with modems is an example.

While other peripherals can be on the sio, it would probably be confusing when more than one computer requests to use it. The other computers would have to have software to ignore requests not coming from them.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Isn't there anybody in the USA or Canada that will do repairs on Atari 8 bit machines?
Don't Video61, B&C, etc. have a repair service?
Maybe you can ask Bob Puff if he has time?

CU Mathy van Nisselroy

PS the ABBUC has a repair service. (actually two, one is specialized in floppies) But that's in Germany.

> have software to ignore requests not coming from them.

It is possible to have 2 Atari systems at either end of a SIO bus with
at least one floppy between them- BUT the I/O to the floppies must be
carefully sequenced to prevent interference. Care must also be taken
to ensure files are closed when switching to the other Atari to
prevent the floppy VTOC from being changed out from under what the DOS
on both machines expects.

Then maybe what we need is a smart network/hub.

A couple of years ago, I received the docs and plans to Rudolf Cornelissen's replacement for the 850. It doesn't handle 7, 6, or 5 bit data, and has only one RS232 and one Centronics port (make that connector), but it has it's own 6800 (yes, 6800, not 6502. But still 8 bits). This baby will, if used with the XL/XE switched off, pick up your phone line, via a modem, and can then receive small messages. It's a nice design, but can be improved. Each ACIA (2 inside, one for SIO, one for RS232 iirc) get's 8KB while it only needs 2 addresses and the PIA also get's 8KB of address space where it only needs 4 addresses.

If we decode memory a bit better and move the chips closer (in address space) there should be room for more PIA's and ACIA's. One or more ACIA's could be used to network. You just tell the 6800 you want to connect all for 'gamelink/multidash' mode, allow a certain computer to access periferals (this could be switched. One computer get's access and 10 seconds (just a number) after the line if free, another computer can access the SIO bus. And there could be a 'hey, computer x, I want a file you got on your harddisk, can I have it' mode. Where computer x would first, via the same utility that would transfer the file from it's harddrive via the hub to computer y, allow computer y access to it's SIO bus. If this utility would not be run, no access is given to y to talk to x.

CU Mathy van Nisselroy

PS I've tranlated the docs from Dutch to German. But I still have to check the translation. It's kinda like translating the 850 manual.

Actually, I know someone in the Hamilton area who will repair 8 bit Atari stuff. However, considering that there are many many working 8 bit Atari machines that people wont give even 20 bucks for, I doubt that unless a particular unit has sentimental value, they are not worth repairing.

: to find this gem?

Ok, doesn't seem to be on any sites indexed by XL Search, but
I'm trying Google for '"The Prisoner" atari basic', and might be
having some luck.

Let's see, now...

http://bridge.anglia.ac.uk/~systimk/Articles/Prisoner-Faq.Html
"There was an adventure game out during the 70s, available for the
Atari and Apple computers, called The Prisoner. It was made by Edu-Ware."

Ok, time to search for '"The Prisoner" atari edu-ware':

http://www.cyberroach.com/analog/an16/prisoner.htm
"Edu-Ware Service's new Prisoner II is an animated graphics adventure that
recreates the Village (although they have rebuilt it as an "Island") and
populates it with electronic frustrations no less sophisticated than the
original."

Hm... Searching for '"prisoner 2" atari edu-ware':

http://cvmm.vg-network.com/vgisep83.htm
"My favorite Atari 800 game of the month: Prisoner 2, by
Interactive Fantasies. A great game (especially for fanatic followers
of the old TV series), and more than a little disturbing. Now if only
they'd fix those damn bugs..."

Huh? By "Interactive Fantasies" all of a sudden? Okay:

http://www.if-legends.org/~yois/vault/eduware_prisoner2.html
[scans of two different boxes for the Apple II version of the game]

B&C doesn't seem to have it:

http://www.myatari.com/bc800d.txt

You might want to check with Best Electronics or some other
vendors, in case they have it in stock:

http://best-electronics-ca.com/

Unfortunately, eBay comes up with nothing.

Let us know if you have luck!

-bill!

900. FA (Ebay): ATARI cartridges - Ends Saturday night.

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-08 21:12:56 UTC
From: bobbyshaw@aol.com
Message-ID: <20020208161256.08536.00000342@mb-fo.aol.com>
Source record: 31270

Hi Everyone, I am currently auctioning off all my Atari 8-bit cartridges. I have listed them all individually (29 cartridges), so this is your chance to pick up only the cartridges that you need. Many of these include the original manual, and a number of them are listed as rare or uncommon on the 8-bit cartridge list My shipping charges are very reasonable - $1.50 for one auction, $0.25 for each additional auction. Here is the link to my auctions:

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?MfcISAPICommand=ViewListedItems&userid=bobbyshaw%40aol.com

I'm getting some pretty good bids on some of these, but the one I'm disappointed in so far is the Bug Hunt auction. I have included the light gun with this, and it is still sitting at $1.00. I have seen the light guns sell separately on Ebay for as much as $20.00. Here is a direct link to that auction:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1330229844

Here is the rest of what I'm selling and its current high bid amount as of Friday evening:

Astro Chase (w/ manual) - $1.50
Atlantis (w/ manual) - $1.25
Basketball - $1.00
Buck Rogers Planet of Zoom - $1.50
Bug Hunt w/ light gun - $1.00
Caverns of Mars - $5.53
Centipede (w/ manual) - $1.00
Computer Chess (w/ manual) - $1.25
Congo Bongo - $1.00
Crossfire - $1.00
Defender (w/ manual) - $1.25
Demon Attack (w/ manual) - $1.25
Donkey Kong - $1.25
E.T. Phone Home! - $1.00
Flight Simulator II cart & 5.25 disks (w/ manuals) - no bids - $1.00 start
Gorf - $1.50
James Bond 007 - $3.25
Missle Command (w/ manual) - $1.00
Pac-Man - $1.00
Pole Position (w/ manual) - $1.00
Popeye (w/ manual) - $5.25
Q*bert (w/ manual) - $3.25
River Raid - $1.00
Soccer - $1.50
Space Invaders (w/ manual) - $1.25

Star Raiders - no bids - $1.00 start
Super Breakout (w/ manual) - $2.28
Assembler Editor - $2.25
Basic cart. w/ 2 books - $6.49

Thanks for looking!

As usual I have to say that the game (Prisoner, v3.0, 2 sides, basic,
(c)EduWare) indeed exists. Holmes, when are you going to reopen your
site? ;-) I'm not going to send it to everybody. On the other hand, all
of my disk images are from internet, so it must be somewhere out there.

I've been thinking of things along these lines too. From a previous
life I inherited a small pile of octal uarts, which would serve nicely
as interfaces to 8 Atari-scale devices. I imagine a basic 16 bit
processor like an 80188/186 and some ram would be adequate to service
all 8 channels- something on the magnitude of a

http://www.vestatech.com/188_ds.html

Since its pretty fast and has lots of space for code, it would be
possible for the board to serve Atari computers or act as a proxy for
device I/O. I think a little built-in device driver for letting an
Atari select some set of devices would be pretty straightforward. A
nice property of the design is most of the code could be written using
DOS 16-bit C compilers, debugged there as much as possible, then
hacked to burn into ROMs- a native host makes this stuff SO much
easier to write.

I'm in the middle of building an Atari disk emulator which uses compact flash for storage, essentially splitting the CF card into a bunch of floppies. The size of the CF card is not limited, it only must support the CF true ATA mode. The controller firmware is written to allow any given floppy to have 128, 256 or 512 bytes per sector, with up to 2^16 sectors each. The unit has a serial port w/ RTS/CTS flow control thru which a PC can load/unload disk images, and has a protocol to select the particular images to act as disk devices. The board connects all the SIO data lines to the controller, allowing users to roll their own custom projects. The only trick is the controller cannot simultaneously talk to the PC and the Atari, as the serial port is electrically switched between them. The controller is a PIC 16C74 or 16C77, 40 pin dip, w/ socket and 10 or 20mhz crystal.

The circuit board is laid out and I have the basic I/O code written for the controller, I just have to get ~$150 put aside for the first run of 8 boards (the effective minimum quantity given the board size and our fabricator's terms). Once they're running, I was thinking of selling them preassembled & tested, at cost, to anyone interested.

I'm thinking they should end up costing about $80 US each (maybe less), complete with programmed OTP controller and open source firmware, but not including a CF card. It features a bunch of blinky multicolor leds, a few buttons, and runs on 9-25V AC or DC.

Once I get the above board built and working, I'd be glad to give something else a try.

Gregm

Aaron Wheeler (Holmes). I read at his site that someone had
demanded he remove some titles. The company and
titles were mentioned. It was some Atari 8-bit company.
Holmes had to figure out which ones were this type.
I'm sure Holmes is trying to do the right thing by this person
and anyone else who complains.

Unrelated is the millenium copyright act, which says it
is illegal to post online about defeating copy protection. I believe
this act prohibits distribution of reverse engineering tools (a pencil
and piece of paper?).

Then there are midi files. Files which people make and don't mind
them being distributed. The music industry is starting to pick on
midi file sites, saying the files require a royalty for every download or
something like that.

The MCA mentioned above doesn't recognize any legitimate way
to backup software you have purchased, and there is no requirement
for disclosure that a software is protected to make a decision on whether
or not to buy it.
Pardon any inacurracies, but I think the basics of what I'm saying are
correct.
Rambling Russg

Hometronics Telecourt TV Game HVG-220

Hi everyone-

I found one of these for a dollar today at a thrift store and would like some more info on it. How old is it? Who made it? Was it a big seller (probably not)?

Any help is appreciated.

Also, if anyone knows about Macs, I found a Quadra 610 and Performa 476 and would like to know how old THEY are and if they are worth firing up.

Thanks,
-ID

You were a little vague re: what cleaning was attempted on that 800. The individual keycaps are a possibility as well as the ribbon connector to the motherboard. One of my 800s just required reseating that ribbon connector to restore use of 6-7-8-9-0-Clr.

Sorry, Spike;

per Mathy - it only runs on a *real* Atari 8-bit machine with associated hardware. Here is a link to HiasSoft:
http://www.horus.com/~hias/atari/

That utility will read or write Atari disks in a 360K PC floppy drive, but *only* in true MyDos 180K double density and *not* the single 90K or enhanced 130K Dos 2.5 density.

You can find this prisoner game now, l thanks Jindrich K. online at:
http://homepages.paradise.net.nz/atari/

Check out the 'new games' page for it. Please note, I'm having trouble with
my main ftp site, so only the latest new games are available at the moment,
hope to resolve this soon.

Todays new games:
Gnome Ranger
Prisoner 3.0

Holmes

I do have Caverunner on tape as well as ES Forth. Never got around to buy
the Tarot game, which I think I should have. Anyone want to sell one ?

"Mr.Bacardi" <mr.bacardi@freenet.de> skrev i melding
news:3C5EAE50.7060605@freenet.de...
Hi Carsten !
Yep, it should be a programming language.
On the cassette cover is written:
* Basic dictionary is compatible with Fig Forth
* Complete set of I/O extensions
* Build-in editor definitions
* Atari Basic compatible graphics commands
* Automatic control of Atari Player Missile graphics
* Build-in sound commands
(and more ...)
ES_Forth should run with Atari 400/800 with 32K (and XL, of course)

I found the cassette cover on the Pooldisk 2 CD, so the program is existing
!

Greetings,
- Mr.Bacardi -

Klax was originally an Atari arcade stand-up from the late 80's.

There was a C-64 conversion made, so there's a good chance that the Atari
8-bit has one too.

Any description? Does this game use cartridges, or is it one of the many
Pong clones?
I remember one old video game system that was triangular, with a steering
wheel on one
side, a gun on one side, and IIRC the third side was Pong (or tennis; Pong
was Atari's
trademark).

>Any help is appreciated.
>
>Also, if anyone knows about Macs, I found a Quadra 610 and Performa 476 and

Try a search engine. Somewhere there must be a site on the history of Apple
computers.
Anything is worth firing up if it's complete enough so you don't have to
spend $100 or
more to get your $10 computer running.

Yes, Mathy forgot to include the "http://" part and thus the link is treated
as if it were a local file...

Well, I'm happy to upload any games that any body wants to my webpage.
I just need to know it's title, and It'll be online within a few days.

http://homepages.paradise.net.nz/atari/

All files are back online now, the ftp troubles have past thanks to an
excellent
webspace provider!

Obviously I can only provide what i have, which is alot, but not ALL games.
:-)

Regards

Aaron (aka. Holmes)

well I think, there is no "Klax" avail for 8-bit atari. The only clone
in know was "Glaggsit!" from a german programmer. I forgot the name.
If someone is interested, just e-mail me.

The page with game titles and scanned images with
cover art is impressive!

I know I have the tape version of "Robin Hood" with a
cover in good condition. I can scan it and send the image
file to you, in case you have not received it via mail
already, after announcing the web page.

Anders

931. Will scanners harm floppy disks?

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-11 21:40:56 UTC
From: bobbyshaw@aol.com
Message-ID: <20020211164056.02125.00001192@mb-ch.aol.com>
Source record: 31302

As ya'll have probably seen... I am currently selling off my old Atari stuff (and gaining a closet back!).

The next lot to go is going to be my 5.25 floppy disks. I would like to get some nice images of the disks for the auctions, but I'm not sure if scanners have anything to them that could harm the floppies. I have an HP 3400C if that matters. This question doesn't *really* pertain specifically, except that they are Atari disks I'd be scanning...

Is there enough light, heat or anything magnetic in the scanner mechanism that could hurt the floppies?

I sent this question to HP support, but who know if/when they'll respond.
Thanks for any info.

Robert Shaw

As in an Atari 800XL and a 130XE, years and years ago. Found this ng from the Atari FAQ, old but interesting, which was on Atari800Win's site. I'm not new to emulation, I've been using other emulators for quite a while. I just have a question about a few Atari games, was wondering if anyone got them running, and on what emulator and settings. First off, Questron. I've tried it on varions versions of Atari800Win/Plus, it seems to crash when you start a character and right after you insert disk 2. On XFormer you can run it, but some of the graphics look like text and you can't read the bottom of the screen, I'm assuming that's where your stats and food and all are (I really don't remember that far back :)). Second, Hacker, that seemed to run great on Atari800Win up until the end where you hit Enter to view the newspaper at the end, then it crashed. Third, NeverEnding Story, not a very hard game but I loved the movie and never played it so I thought I'd give it a try. Worked up until Act 3, when you hit enter to load it the screen just garbles, tried it on a few versions of 800Win/800Win Plus so far. And I managed to get Gemstone Warrior working on Atari800Win 2.5C in case anyone's interested, so far anyway. Always seemed to crash on startup on every other emulator with what I thought was a disk error message, something like bad system disk, seemed image related and not emulator related. Don't have my computers anymore, wish I did now. :)

Some of the crashes you suffer could be from bad disk images that no one
ever played through to the end to test. I've come across a few of those here
and there. I have the disk version of hacker and it's extremely copy
protected, I would bet money the image you have isn't 100% playable.

The original version of Colony had a bug which screwed up the graphics when you picked up some things and went completely mental when you plugged a battery into the droid. The same bugs are in the ATR I've got for the game

Does anyone know where I can get a patched/hacked version of Colony in which these bugs have been fixed?

Source record: 31312

Well,
the problem is, there are (almost) no new demos. the polish demo programers and groups like taquart, tight, slight, new generation, our soft, excellent, pentagram and many others have disappeared. they are programming the falcon, amiga or pc now. the latest big or mega demos I have seen (128k or more memory) came from AIDS and Quasimodos. AIDS released Khai-Et (320k memory required) in late 1999 and updated it in early 2000. The Quasimodos released Ergo Bibamus (128k memory required) in 2001. These are the latest megademos I know. if you take a look at several polish homepages (like Atari-area) or read about several eastern european conventions, you may find out, that there is only a small number of atari users that visit these conventions. Thus, not many new things are released. Mainly 256 bytes demos, pics and sounds, but no new megademos... -Andreas.

942. Atari Ramdisks...

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-12 15:00:42 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3C692E1A.5E8601C5@students.uni-mainz.de>
Source record: 31313

Hello Folks,
here is the first edition (first try) of my Atari Ramdisk overview. You can call this info bare bones, but it is all info I have at the moment. If you have more information and like to fill in the gaps, just e/mail me. The text is formatted for 80 chars, pure ASCII (not ATASCII)...
-Andreas.

P.S. To Michael Current, insert numbers instead of X and Y...

----------cut here---

X. Atari Ramdisks - a short & very incomplete Overview:

Right from the start of the Atari 8-bit computer era in the late 70`s, Atari users wanted to have as much RAM as possible (or as their purse could afford). Having a 16k machine with a tape device was nice and cheap, but having full 48k or 64k and a floppy drive was much nicer (and very expensive). Thus many Atari users began to create selfmade RAM
extensions and enhancements, just to save some money. Also a lot of firms
provided extra RAM, RAM enhancements, RAM extensions and Ramdisks. Besides Atari there were (and still are) quite a lot of producers, manufacturers, distributors and authors of such RAM enhancements...

This short and incomplete overview does not provide any docs or manuals,
but gives some info about the various Ramdisks on the market. Since these
notes are written by me, they will merely contain the information I have.
And as you all can see - it isn`t much information. So any help and extra
info, as well as corrections, are very welcome. It would be nice to see this text & info growing. For now let us start here, the info-section is divided into 8 groups:

1) Name (Name of the RD, e.g. Megaram 2 or Rambo XL or MIO, etc.);
2) Vendor/Author (or distributor, manufacturer, producer, etc.);
3) Size (size of the Ramdisk only; NOT the full computer memory);
4) [Bankswitching] Area (for XL/XE computers usually 4000-7FFF);
5) Banks (hexadecimal input count, as in MyDOS or RAMDTEST.BIN);
6) Control Bits (which bits are used to control the RD);
7) Port (control Port - usually Port B for XL/XE machines);
8) Notes (any extra info, comments, miscellanous things, etc.);

If you wish to add any other type of info, let me know. The above
information should be enough for most programmers to support a RD in
their programs (especially to support more than just one type of RD).
Hopefully future programs will take care about this info or just use
a small setup program to setup any kind of RD. Now let me begin:

X.1 Atari 400/800 Ramdisks:

Name Vendor Size Area
Banks Bits Port Note

- Axlon Axlon/Atari 64k C000-FFFF
unknown unknown ? (CFFF) plug-in-board

- Axlon Axlon/Atari 128k C000-FFFF
unknown unknown ? (CFFF) plug-in-board

- Mosaic unknown 64k C000-FFFF
unknown unknown ? (CFFF) plug-in-board

- Mosaic unknown 128k C000-FFFF
unknown unknown ? (CFFF) plug-in-board

- Peterson P.Peterson 64k-1024k C000-FFFF
unknown unknown ? (CFFF) selfmade-RD

- ...

X.2 Atari XL/XE Ramdisks:

Name Vendor Size Area
Banks Bits Port Note

- 130XE-RD Atari 64k 4000-7FFF
E3,E7,EB,EF 2,3 B ($D301) old=8k Chips, new=32k Chips

- Megaram 1 Compyshop 256k 4000-7FFF
23,27,2B,2F 2,3,6,7 B ($D301) uses 16k Chips (27128x16)
63,67,6B,6F
A3,A7,AB,AF
E3,E7,EB,EF

- Megaram 2 Compyshop 256k 4000-7FFF
23,27,2B,2F 2,3,6,7 B ($D301) uses 64k Chips (27512x4)
63,67,6B,6F
A3,A7,AB,AF
E3,E7,EA,EF

- Megaram 3 K.Peters 1024k 4000-7FFF
unknown unknown B ($D301) uses 256k Chips x4
B ($D600) also uses switches for:
a) 256k x4 (4 Ramdisks)

b) 512k x2 (2 Ramdisks)
c) 1024k x1 (1 Ramdisk)

- Newell Newell Ind. 192k 4000-7FFF
A3,A7,AB,AF 2,3,5,6 B ($D301) comes as 64k RAM + 192k RD
C3,C7,CB,CF
E3,E7,EB,EF

- Mathy`s RD M.v.Nisselroy 1024k 4000-7FFF
all 64 Banks 0,1,2,3,6,7 B ($D301) Pin-switching in RD: 4,5
separate Antic/CPU: yes!
no use of any switches!

- missing info for the following Ramdisks:
Newell 512k+1024k, Atari Magazin 256k, Bob Wooley RD, Rambo XL,
P.Peterson 256k-1024k, TOMS 256k-1024k and many others...

X.3 PBI-devices (XL=parallel Bus, XE=Cart. Port+ECI):

Name Vendor Size Area
Banks Bits Port Note

- no information yet!
- missing info for the following Ramdisks:
ICD MIO (256k+1024k), Yorky XL (256k), Turbo-Freezer XL (256k)
and many other PBI devices...

X.4 other Ramdisk types and devices:

Name Vendor Size Area
Banks Bits Port Note

- no information yet !
- missing info for the following types and devices:
Flashrom (512k), Rambox (64k+128k), Ramcart (64k-4096k), CP/M,
ATR 8000, Turbo 65816 (or 65801 / 65802) and other types...

Well, thats it for the beginning - it ain`t much, I know, but any help
is
much appreciated. If you have some info, notes, corrections or other
things
that might help, let me know. Thank you - Andreas Magenheimer.

P.S.: For this first edition special thanks go to: Lee Barnes, Russ
Gilbert
and Mathy van Nisselroy for sharing their info with me...

943. Programs with RD Support...

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-12 15:07:28 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3C692FB0.4EC4E14@students.uni-mainz.de>
Source record: 31314

```
Hello Folks,
here is a short list of programs that have built-in RD support. As
always corrections and updates are welcome. The text is formatted in 80
chars. pure ASCII (not ATASCII). -Andreas.

P.S. To Michael Current, if you are gonna use this text for the A8FAQ,
then use numbers instead of X and Y...

-------------cut here-----------------------------------------------

Y.1 Ramdisk-supporting Software:

Well, I will only list commercial or former commercial programs here,
that have built-in ramdisk support. Why? Simply, because most if not
all
PD programs can support a RD, as soon as the user a) has a special DOS
or RD driver or b) has a special OS inside the computer or c) has any
kind of special and non-standard hardware. Just one example: With the
use
of QMEG+ OS it is possible to freeze ZORK (or any other protected /
unprotected program) into the RD, then re-direct the RD as being drive
1
and finally boot Zork off of the Ramdisk, allthough Zork does not
support
a RD in any way. The same funny things can be done to other copy
protected
programs and especially to unprotected public domain programs...
Ok, enough said, let me begin:

------------------------------------------------------------------------

Y.1.1 DOS programs:

- Atari DOS 2.0 (selfmade RD drivers avaiable);
- Atari DOS 2.5 (driver for XE-RD and various selfmade drivers);
- MyDOS (supports Axlon and XE compatible Ramdisks up to 1MB?);
- Sparta-DOS (supports XE compatible RDs and others up to 1MB?);
- Happy DOS II+D (supports XE compatible Ramdisks up to 256k);
- BiboDOS (supports XE compatible RDs up to 256k);
- TurboDOS (supports XE comp. RDs, MIO, Irata, etc. up to 256k)
- TopDOS (supports XE comp. RDs and Axlon RDs);
- BeweDOS (supports XE comp. RDs and Rambox);
- SuperDOS (supports XE comp. RDs up to 256k)
- guess there are dozens of other DOS versions that support a RD...

------------------------------------------------------------------------
```

Y.1.2 non-DOS programs:

- Synfile (+) by Synapse supports Axlon-RDs;
- Syncalc (+) by Synapse supports Axlon-RDs;
- Synhome (+) by Synapse supports Axlon-RDs;
- other Synapse applications should also support Axlon-RDs;
- A.R.-The Dungeon by Datasoft supports 48k, 64k and 128k (XE-RD);
- Paperclip-II by Batteries Inc. supports 130XE-RDs;
- Atari-Writer-Plus by Atari supports 130XE-RDs;
- Atari-writer-80 by Atari supports 130XE-RDs;
- A-Text 130 or Austro-Text 130 supports 130XE-RDs;
- Page-Designer by XLent supports 130XE-RDs;
- Type-Setter by XLent supports 130XE-RDs;
- other applications by XLent support 130XE-RDs;
- 4bit-Sampler by Mirage/ANG supports 64k, 128k and 320k memory;
- The Brundles by KE-Soft supports 64k, 128k and 320k memory;
- Lightraces (Tron) by Power per Post supports both 64k and 128k memory;
- Adalmar by Power per Post supports both 64k and 128k memory
- Megablast 1 by Thorsten Karwoth supports both 64k and 128k memory;
- thats all I remember right now...

Note: - Axlon means any Axlon compatible Ramdisk;
- 130XE means only 128k (for more extra Ram you have
to change the program, the DOS or the RD driver);
- 320k memory means any XE-compatible RD with 64k RAM
plus 256k extra Ram / Ramdisk;

Thats all for now. Thanks to Russ Gilbert and Lee Barnes for sharing
some
info with me. Any further help or info is welcome !! Andreas
Magenheimer.

944. Programs that need a RD...

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-12 15:14:52 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3C69316C.E43C9CD3@students.uni-mainz.de>
Source record: 31315

Hello Folks,
here is a short list of programs, that absolutely need a RD. It is still
incomplete and thus additions, corrections and updates are welcome. the
text is formatted to 80 chars. pure ASCII (not ATASCII). - Andreas.

P.S. Again Michael, if you are using this text in the A8FAQ use numbers
instead of X and Z...

--------------cut here---

Y.2 Atari programs which need extra Ram / Ramdisk:

The memory values given are not always fully correct, since I do not
have all kinds of memory settings or Ramdisk types. At the moment I
merely have machines with 64k, 128k and 320k memory. Thus I cannot
tell if a program may work with 192k or 256k (or more than 320k), since
I do not have such machines. Any help or correction is welcome...

Y.2.1 non-Demo programs:

- T-34 by Mirage/ANG needs 128k memory (a 130XE is enough);
- Mister X by Power per Post needs 128k memory (130XE);
- Kaiser 2 by Power per Post appears in 3 versions,
one 64k version, a 128k (XE) version and a 320k (CS) version
thus, if you have the 128k or 320k version you need a RD...
- Castle of Blackthorne by thimo Graef needs 128k memory;
- Gizmo`s Castle by Black Panther is avaiable in two versions:
the 64k version and the 128k version; if you have the 128k
version you will need a 130XE or compatible machine;
- Oelbaron by ??? (author unknown) also comes in two versions:
a 64k and a 128k version; a 130XE or comp. is needed for 128k;
- Boss-XE by Mirko Sobe needs 128k minimum memory (XE or bigger);
- Boss-X by Mirko Sobe needs 128k minimum memory (XE or bigger)
- MTOS 1.0 and 1.1 by Tom Hunt need 128k memory (XE), there is
also a 256k version of MTOS (64k RAM + 192k RD; probably Newell?);
- Snapshot by ??? (author unknown) needs 128k minimum memory;
- XL2 by J.K. Picken needs 128k minimum memory; supports also
bigger XE-comp. machines up to 1MB (?);
- the CTH-Sound-Utility by Tom Hunt (a Wave+DIG Player) supports
64k, 128k, 256k, 576k and 1088k machines; uses 16k RAM+RD for the
Digi-Sound, thus a 64k machine is often to small!; does not support
320k machines, nor Compyshop-RDs;
- Datei 4.0 and 4.1 by ??? (author unknown) both support 128k (XE)
and 320k (Compyshop) machines;

- various Filemanagers/Filecopiers support XE-comp. Ramdisks;
i.e. you need 2 drives if 48 or 64k RAM, only 1 drive + RD if
extra Ram / RD is avaiable;
- various 130XE-test programs need 128k RAM, e.g. for bankswitching
tests and/or other things (can be found in many magazines);
- various System-test programs support 48k or 64k as well as extra
RAM; since they were (mostly) written to detect the extra RAM /
Ramdisk, you "should" have more than 48k or 64k memory...;
- some XE-Sectorcopiers absolutely need a minimum of 128k RAM;
- there are also some Tape programs (Tape-Disk-Copier, Tape-Tape
Copier, Disk-Tape-Copier, etc.) that need a minimum of 128k RAM,
for example VampireSofts 130XE Coolcopy and others;
- there are also some Tape-Ramdisk programs or drivers (which provide
a RD for the Tape users) that need 128k minimum memory;
- no more ideas...

Y.2.2 Demo programs:

- Amiga Boink XE by ???, minimum 128k RAM; XE=yes, CS=yes;
- American Natives Demo by FOX-1, needs 256k RAM; XE=no, CS=yes;
- Asskicker by Shadows, minimum 128k RAM; XE=yes, CS=yes;
- Anime-4ever by ???, minimum 320k RAM; XE=no, CS=yes;
- Base33 by AIDS, minimum 320k RAM; has a RD-setup menu;
- Bill-Pie-Demo by ???, minimum 320 RAM; XE=no, CS=yes;
- BMW-Ani by Mirko Sobe, minimum 128k RAM; XE=yes, CS=yes;
- CES-Demos by XANTH (full version) needs 128k RAM; XE=yes, CS=yes;
- Cogito by AIDS, minimum 192k RAM; XE=no, CS=no;
- Comet-Demo by Madteam needs minimum 320k RAM; XE=no, CS=yes;
- Danielle-Gr.9-Ani by Bill Kendrick should load off of a RD or a
Harddisk (Floppy is verrryy slowww); for a RD-machine 128k total
memory is enough; XE=yes, CS=yes;
- Ergo-Bibamus by Quasimodos, minimum 128k RAM; XE=yes, CS=yes;
- Glashead/HTPPD by AR+CSS, minimum 320k RAM; XE=no, CS=yes;
- Grafik+Sound-Demo by P.Sabath needs 128k memory; XE=yes, CS=yes;
(many different versions, there is also a 64k version avaiable;)
- Halle 1994B (Wormhole) by AR+CSS, needs 320k?; XE=no, CS=yes;
- (Atari) Hardware-Demo by AR+CSS, needs 320k RAM; XE=no, CS=yes;
- I.B.R.-Demo by MacGyver/AIDS, needs 256k RAM; has a RD-setup menu;
- Igor, Side A by Madteam needs 128k minimum RAM; XE=yes, CS=yes;
- Igor, side B by Madteam needs 192k minimum RAM; XE=no, CS=yes;
- Journey by Polynomials needs minimum 320k RAM; XE=no, CS=yes;
- Khai-Et by AIDS needs 320k minimum RAM; XE=no, CS=yes;
- Killer-Whales by Madteam needs 320k minimum RAM; XE=no, CS=yes;
- Lajf-Demo by Madteam needs 128k memory; XE=yes, CS=yes;
- Megablast-Sounddemo by DGS needs 128k memory; XE=yes, CS=yes;
- Muppet-Movie by Madteam probably needs 128k memory?; XE=yes, CS=yes;
- Nascar-Ani by Mirko Sobe needs 128k memory; XE=yes, CS=yes;
- Nonejm by Tight (pre-release) needs 128k memory; XE=yes, CS=yes;
- Owca-Demo by ??? needs 128k memory; XE=yes, CS=yes;

- Owca-2 Demo by ??? needs 128k memory; XE=yes, CS=yes;
- Parrot-X-Mas-Demo by A.Ramos needs 128k memory; XE=yes, CS=yes;
- Pedrokko-Parrot-Sounds (10 Disks / 20 Disksides by Pedrokko)
need 128k memory; XE=yes, CS=yes;
- Raving Vierpz by Pentagram needs 128k memory; XE=yes, CS=yes;
- Raytracing XE by K.Pelzer needs 128k memory; XE=yes, CS=yes;
- Raytracing 320k by ??? needs 320k memory; XE=no, CS=no, AM=yes;
- 1MB Raytracing-Demo by ??? needs 1088k memory; XE=no, CS=no, KP=yes;
- Revenge of Hacker by Rasero Team needs 320k minimum RAM; XE=no,
CS=yes;
- Sweet Fantasy by Tight needs 128k memory?; XE=yes, CS=yes;
- Sheol by Bit Busters needs minimum 320k RAM; XE=no, CS=no;
- Shiny Bubbles by ??? needs 128k memory; XE=yes, CS=yes;
(there is also a shortened 64k version avaiable);
- Stash-Demo by Rasero Team needs 320k minimum RAM; XE=no, CS=yes;
- Starwars-Demo by AR+CSS needs 320k minimum RAM; XE=no, CS=yes;
(always boot with Option to avoid stripes...);
- Timekeep(er) by New Generation needs 320k RAM?; XE=no, CS=no;
- Tit-Demo by Madteam needs minimum 320k RAM; has a RD-setup menu;
- Too-Hard-2 by Animkomials needs 128k memory; XE=yes, CS=yes;
- TheTop-3 (Veronika Part) by WFMH needs 128k memory; XE=yes, CS=yes;
- Total Dazed by Tight needs 128k memory; XE=yes, CS=yes;
- Trabant/HTPPD by AR+CSS needs minimum 320k RAM; XE=no, CS=yes;
- Trip6-Demo by Shadows needs 128k memory; XE=yes, CS=yes;
- Ultra by Taquart needs 128k memory?; XE=yes, CS=yes;
- Vengeance by Excellent needs 128k memory; XE=yes, CS=yes;
- Vent by Exc.+Pent. needs 128k memory; XE=yes, CS=yes;
- Video Blitz by Helvetica Bold needs 128k memory; XE=yes, CS=no;
(also needs separate Antic/CPU access, which the CS does not have);
- WAF-Demo, Side B by WAF members, two parts need 128k memory
(Raytracing and Vector Part); XE=yes, CS=yes;
- Worms-Demo by Datri needs 320k minimum RAM; XE=no, CS=no;
(on a CS-RD you can see the ani with many bugs);
- X-Demo by Madteam needs 320k minimum RAM; has a RD_setup menu;
- X-Files Demo by ??? needs 128k memory; XE=yes, CS=yes;
- XE-Demo by ??? needs 128k memory; XE=yes, CS=yes;
- XE-Demo by SAG needs 128k memory; XE=yes, CS=yes;
- Xyberscape-XE by Bill LeMasurier/TAF needs 128k memory; XE=yes,
CS=yes;
(there is also a 64k version avaiable separately);
- Zero-Demo by New Generation needs 128k memory; XE=yes, CS=yes;

Note: - XE means 130XE Ramdisk (size: 64k);
- CS means Compyshop Megaram 1 or 2 (size: 256k);
(schematics avaiable from ABBUC)
- AM means Atari Magazin Ramdisk (size: 256k);
(schematics can be found in AM 2/1987)
- KP means Klaus Peters Megaram 3 (size: 1024k);
(schematics avaiable from ABBUC)

- has a RD-setup menu means, that you have to hold
down SHIFT upon bootup to get the setup-menu; here
it should be possible to setup any XE-compatible RD;
- I could only test(ify) XE and CS Ramdisks, since
I do not have any other kinds of RDs;

Thats all so far. Any additions or corrections are welcome.
Greetings, Andreas Magenheimer.

Yes, that's what I thought about Hacker and Neverending Story. Questron itself though is technically playable on XFormer, but you can't see your stats or food or anything, which pretty much ruins an RPG, plus the keyboard movement commands are hectic and there doesn't seem any way to remap them. Only copy of Questron I found so far, and that was by way of XL search: http://www.newbreedsoftware.com/xlsearch/. I found the link for that on Atariworld.com. So if anyone's looking for a game, might want to check it out. :)

Well, I got to Act 3 in Neverending Story on a C64s. Plus Questron seems to be working great so far on AppleWin, on Commodore the gambling didn't seem to work, and that was always my favorite part of the game I think. I'm not going to be picky about what emulators I use, not with the way disk images are. :)

: Thats all so far. Any additions or corrections are welcome.

However I wrote the demo at the time I only had a 256Kb 800XL with "AM"
ramdisk, it should run on any 256Kb machine since it uses standard DOS +
RamDisk. As long the DOS can access the whole RamDisk it's o.k. The speed of
the digitized audio depends on how fast DOS can read data from the RamDisk.
If it reads slow, well, there will be a longer pause between the sample's...

Please allow me to jump in and ask an XEP80 related question.

I have one that has a ribbon cable with a small 9-pin (?) connector on
the end coming out of the case.

I remember seeing a mention of a "TTL" (?) mod for the XEP80. Is this
what I have? And, what the heck do I do with it?

Thanks for all the replies. I'll try these things next week. I doubt I'll have much success with the 130XE since all the chips are soldered instead of socketed. My attempts on the 800 keyboard centered on cleaning the contacts under the keycaps. I haven't tried checking the cable.

I'm fairly certain the power supplies aren't an issue since I started with a known working set and then just swapped computers/drives. I suppose it's possible something happened to the power supply partway through this process so I'll go back and check those again.

The 800XL that only shows b&w is through the modulator. I'll try it on a monitor as soon as I dig up the correct cable.

Thanks again!
-Ron

The original thread that you responded to is no longer on AOL, and you didn't quote any of the message you responded to. So, I don't quite know what the original discussion was about...

But, here's a link to a screen shot of Caverns Of Mars:

I'm happy to redump both Hacker and Neverending story, but would need
someone with a walkthrough to check them out, and play them right through.
I have two versions of Questron, one is a fairly close to original but
cracked, the other is cracked but with cracked title screens too. Both work
for me in Atari 800 emu 2.8. But one other person has had trouble with the
first version, even though it works fine on my PC.

Obviously I'm not playing them to the end, just a quick play. So i might be
missing something.

Are there any other 'bad dumps' out there, while I've got the SIO2PC cable
out ;-)

Maybe some of you guys that are heavily into demo's could make a list of requirements (including not only RAMdisk size but also if it need a perticular upgrade. Maybe even if it will run on different OS's or just the Atari OS). I managed to unatr one of Sven's demo files (I only tried only one, because they are pretty big.) and some files just will not run. About have way through it dawned on me that some might need more memory then my 65XE has. (it only has 128kB)

If you open the XEP80 up and all the wires are soldered to practically the
same place, it's probably Bob Woolley's TTL upgrade.

Since you're willing to hack around, have you read Erhard Puetz's articles in ABBUC Magazin? If not, they are (in English) on my site at http://www-users.rwth-aachen.de/mathy.van_nisselroy click on some stuff I collected and scroll down to XEP80.ARC. The BobTerm driver for the XEP80 is on the same line (speed increased from 4800 to 9600 baud). I thought I'd seen the XEP80 system disk on the net, but can't find it.

BTW do you have the data sheets on the NS405 (the XEP80's main chip), they say it will even do colour, 64kB by 16 bits and even bank swapping is mentioned.

Hans Christoff Tuchen also wrote a couple of nice articles (for ABBUC Magazin) about the XEP80. Even how one could use the intensity bit. (IIRC)

CU Mathy van Nisselroy (who has three
XEP80's. One updated with Bob Woolley's TTL upgrade. I got the last one for free. As Andreas already mentioned, they were given away once. But people wanting them should check out http://www.abbuc.de and click on shop. The site is in German, but with a bit of guessing you'll get to the right place. These XEP80's are cheap, even INCLUDING postage.)

Howdy folks

I've added some photo's of my BlackBox and FloppyBoard to my site at http://www-users.rwth-aachen.de/mathy.van_nisselroy. I took the pictures before I made some improvements. Pictures from after the improvements will be added later.
My photo's are scanned.

A couple of questions:

- How can I make better scans? Have a look at the other two pictures by Nir Dary and Bob Puff. Less bytes, more detail. (Nir has a digital camera. I don't.)
- I seem to have small grains of dust on the photo's. Can I wipe them with water or will that damage the photo's?
- How do you like the fake wood grain of my desk? (read: should I take it out of the picture and if yes, how?)

I know that using ATRUtil, it's possible to take a .exe file and convert it into a "Kboot" .atr image... is there any way to automate this, to convert all the .exes in a single directory all at once? With ATRUtil it's fairly cumbersome and they need to be done one at a time...

As part of doing my TOSEC renaming, I'd like to try to get everything possible into .atr format, already many of the renamed ones are Kboot conversions, and I'm sure there's a lot of duplication between the current .atr database and the .exe database.

Back when XLit 0.20 was the most popular emulator, I set about doing this, converting the EXE's to ATR. I remember using makeatr in a batch file. And it would do a whole directory (around 800) in a few minutes.

I think I just renamed all the *.EXE to just *. and then ran a batch file with this in it.

For %%T in (*) do makeatr.exe %%T.atr %%T

Works a treat.

Yes they are. But with the generic symptoms you give, there are many possible explanations as to what may be causing it. And about the best way to determine that is to have someone knowledgable about repairing such items look at them. But it looks like you got enough computers there that you could use one for parts to fix the others.

> >For the record, the problems are:
> >800 - several keys don't register and cleaning didn't help.

This could be a bad POKEY chip or TTL driver chips. Maybe a broken keyboard.

> >800XL - works OK but only in black and white.

This could be a defective ANTIC or GTIA chip. Maybe the potentiometer used to adjust the color/tint is off and just needs to be adjusted. Maybe a bad RF modulator. Does this also occur if you use the composite video output?

> >600XL, 800XL, 1200XL, 130XE - only sign of life is the power indicator.

Is the power supply your using to test these good? A power supply may seem to work but still be defective (i.e. can't handle the required current output needed by the computers). Or they could've all been fried by the same power supply. A bad memory chip can also give this indication. One best way to see if there is a shorted out chip is to turn the machine on and touch each of the chips inside the machine. If you find a chip that is hot to the touch then that may be the problem.

> >810 & 1050 drives - "boot error" message.

Depending how long they've been last used, they probably just need a good head cleaning. An old cleaning disk and rubbing alcohol can do some good. If you don't have a cleaning disk, then using a Q-tip and rubbing alcohol on the read/write head is another method. Apply gentle pressure on this part, but enough to clean off any residue that's accumulated.

Also, the read/write head may have a pressure pad problem and needs adjustment or the read/write head may need alignment. 810's can sometimes knock themselves out of alignment from the way the drive searchs for track

0. Typically most disk drives have a sensor to do this. Atari eliminated the sensor in the 810 drive and programmed the drive to move the head towards track 0 for a set period of time. Not too much of a problem if the head is moving from Track 39 to Track 0. But if the head was already at Track 0, or near, you hear a longer banging sound from the head mechanism.

And if the read/write head makes a lot of noise during movement, it probably could use some lubrication. Sewing machine oil and a very small amount applied in the correct location can help.

> >
> >I really hate the idea of putting these in a landfill, but if I can't
> >get them fixed....

I agree. They could use a good home instead of rotting away in a landfill.

Best of luck with your repair.

I just downloaded the datasheets from freetradezone and had a short
look into them: the chip itself will only do b/w, but the
datasheet mentions that you could (mis-)use several attribute bits
do achieve color output. Of course, this requires additional hardware,
but if you are willing to do a bit of hacking, it could be possible
to hook up a CGA or EGA monitor.

so long,

Hias

Note also that makeatr is a DOS app and will not handle long filenames which
may
be a problem unless you do not mind renaming the files. I have considered
compiling
a windows console app version as well as make the program accept wildcards
and be
able to automatically generate the output filename when I get a chance.

Source record: 31201

I could try NeverEnding Story up to Act 3, which is where I had the crash on Atari800Win (various versions), but not sure I could finish it. Don't want to use a walkthrough. I have a walkthrough of Hacker and could get to the end again to check. As for Questron, I'm not sure if I tried Atari800 2.8, on the official site it showed 2.6C as the latest version, I'm assuming 2.8 is Plus or something. I'll find it and check it again, but it locks up right at the beginning so I could check your version on Atari800Win 2.5c (which is what I'm using since it seems to have great compatibility with mostly everything, including GemStone Warrior. Feel free to post the games here.

981. Questron didn't work on Atari800WinPlus either, same thing

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-15 03:00:58 UTC
From: Sean Whalen <whalens@home.com>
Message-ID: <KR_a8.46339$X64.16028537@news1.rdc2.pa.home.com>
Source record: 31202

When you start a character and are asked to insert the second disk, when you do and hit enter, a few seconds later it crashes. I tried various settings. Turnning off the ROM patches didn't seem to help becaise it seems to be required. (I'm assuming these are patches for ROM bugs?, isn't there a way to patch the ROM file itself? I'm new to this...) Gemstone Warrior didn't work either, it gives you the same error as everything I've tried but Atari800Win 2.5c: "A DISK ERROR HAS OCCURED RESET SYSTEM A", it cuts off and then the crash message there. But it gets past it on 2.5C.

I really don't mind using 3 emulators if I have to, I don't know if it's my imagination or not but Atari seems to be more complicated of an emulator than the other ones I've used. All those OSes, disable basic and patches, tons of versions of Atari800Win with one running some games and another one running other ones. I love Atari, I used to have an Atari computer, but in all due honesty I think it was the games I loved more than anything. And I'm glad I can play them, whatever emulator it's on. If you read my post above you'll see I got Questron and NeverEnding Story working on AppleWin and C64S respectively. Hacker I tried on C64s but for some reason you run out of time right as you get to Washington DC and before you can hit up, think it might be an emulator timing issue or it needs some sort of patch or something. :)

983. I hope I didn't sound too rude with that testing comment

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-15 03:17:34 UTC
From: Sean Whalen <whalens@home.com>
Message-ID: <i5%a8.46375$X64.16042340@news1.rdc2.pa.home.com>
Source record: 31204

It's just I've been doing a lot of troubleshooting lately, not just with Atari emulators either. It's just frustrating playing any game, getting to the 3rd Act or whatever or the end like in Hacker and having the whole thing crash. I've never had that happen on any other emulator, but I don't play them too much. Feel free to "redump" the games and let us know where they are. If they work they work, and if not it's not like the games ever did. :)

heh, no problem, I just made the offer to redump them so that the Atari community would have 'hopefully good dumps' of them. I'll do it in the near future, but It may turn out that the original 'crack' thats floating around is faulty. :-(I just dont have the time to play them through, unless it can be done in like 10mins with a walkthrough.

Will post here once I do them. Think I have several of each floppy actually. All came from different sources, so who knows, maybe one of them works...

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:

Questron seems to work fine on version 3.0 of Atari800win plus.

You can start a new character or use an old one , the game asks for
the next disk and runs fine here. Had my character walking all over
the map..

Not my cup of tea tho..

As for Gemstone, it's almost certainly an emulation problem and I'll
have a word re this.

> What crime did you commit to deserve such a punishment?

I'm using the free services of the university. And some bone head somewhere decided they needed M$ stuff. They updated the servers and bought the computers for this computerpool with everything already installed. One 'small' side effect, the installation won't allow anyone to change where there mail and default stuff is stashed. Meaning I have to download every email since mid november every time I log in. I have to subscribe to all the newsgroups over and over again. (if I ask a question in a different newsgroup I better write down the name of that newsgroup) And I have to sift through all the mails in the newsgroup to search for the new ones. They are not highlighted since the computer doesn't know I've read them.

Could you tell me the url of the freetradezone and possibly where on the freetradezone you found the sheets? I was gonna scan them (in the not to near future), but if they are already on the net somewhere, I won't. I tried copying my photocopies of the datasheets once, but it lost to much detail.

Quite simple: http://www.freetradezone.com/

You have to register, but it's free. Then just search for NS405 and
you will find the datasheet.

Just as a side note (there have been a lot of discussions about this
topic in the electronics newsgroups): a few months ago freetradezone
changed their policy and several datasheets of chips that are out of
production are now only available if you register with the very
expensive premium account (or what ever they are calling it). This
means, it cannot be guaranteed that a datasheet that's available
for free now, will also be free in the future. So it's always a good
idea to store a local copy....

so long,

Hias

Well, that may or may not be a problem... I'm sure I'll end up with a whole lot of ~1 and ~2 (etc) files, but I'm guessing that there'll already be a lot of duplication with the existing .atrs so anything already done will be renamed automatically... the rest is not a big deal, since most will be dupes or alternates of existing .atrs so I'll already have done the research on them.

Regardless, a Win32 console one would definitely be nice, especially after the DATs have been released, that way others can easily rename their .exes to .atrs and see if there are any that are unrecognized by the DAT...

That s*cks.
A much better idea would have been to
a) assemble the computers themselves, as to give the hardware lab (assuming
ther is one) some exercise to do. "OK, Boys, now we'll assemble 500 computers
and make sure they all work fine"
b) have the systems people install Linux-based servers as an exercise too
(since servers aren't public-accessible PCs, what's actually needed is for them
to work fine and be able to handle the load imposed of them... something at
which M$ is well known to fail)
c) have only the OS pre-installed in the public-use PCs, but add good software
for everything else after that (a friend is attending post-graduate courses in
a Canadian univeristy, and there he found the PCs have installed: Pegasus Mail
3.21c for mail, Forte Agent for news (or maybe it's FreeAgent, I'm not sure),
and Netscape Communicator for web... which happens to be my personal choice too,
and I had been telling him to dump the horrendous M$ stuff he had installed
in his home PC since he upgraded it. (Previously, he was using Eudora and
Netscape, I believe, but like most people, he was too lazy to install them back
when he found M$ Outlook Stress and Internet Exploder installed with Win98)
Now he's seeing the difference.

The guy who suggested that should be lapidated in public and left there for
others to see what happens to such...
Isn't any way you can complain en masse?

Wow, does that bring back some memories of the Atari scene while
I was staying in Petersburg, going to meetings at the Cloverleaf mall
and sometimes seeing Ledbetter there. This was around 1984-5,
we had our own club and bbs's in Petersburg but could access Richmond
as a local call.

Well Mathy,
I tried to include some info which Ramdisk the demos can use (or cannot use) - unfortunately I merely own two different Ramdisks: a) XE Ramdisk (3 computers) and Compyshop Megaram 2 (one computer). Thus I could only tell if the demo works with XE or CS or not. There are just 2 demos I know, which will run on other Ramdisks, these are 1) the 1 Megabyte Raytracing demo (from ABBUC Pd Library, think it was coded by Solocoder of ACE, but not sure about it) absolutely needs a Klaus Peters 1MB Megaram-3. It will not run on any other 1MB ramdisk, unless you change the code (it looks for the control bits). 2) the 320k Raytracing demo by ??? (author unknown to me) uses an AM Ramdisk. At least the info/title screen says so. Next, I just read here, that the American Natives demo by Fox-1 should also work on an AM Ramdisk. but thats it so far. I hope that there are some kind Atarians out there who can share the missing info with me (or with us).
greetings, Andreas.

1006. I couldn't get my copy working on Atari800Win Plus 3.0 beta either

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-15 23:28:25 UTC
From: Sean Whalen <whalens@home.com>
Message-ID: <tQgb8.48946$X64.16543945@news1.rdc2.pa.home.com>
Source record: 31227

I couldn't find Atari800Win Plus 3.0 non-beta, I'm assuming it's still in beta then. :) When I try to start a character, or delete one, create one, and then start him it tells me to insert disk 2, then it goes to a black screen. I have a P700 with 200MB some SDRAM. I'm also using a PCI card with 16MB RAM, my AGP one broke, but I thought that'd be enough for Atari. Anyway, the second time I try, it gives me the crash. I'm attaching it zipped here, it has a charcter I started along with the ones that were already on the disk. If you can get it working on yours, must be something with my PC configuration. I'm on XP too, but I have daul booting with 98, and all the games that wouldn't work in XP didn't work in 98, so I think I got tired of switching to test.

If you can't get any Atari versions working of games, really, don't worry about it. It's emulation, and I've found them for other emulators too. It'd be great if you could, but frankly I don't think it's technically possible to get all games working on one emulator.

Locate the small potentiometer on the PCB. Take a small screwdriver and turn it slowly to the right untill it's starting to show colors. If it doesn't work (properly) you may need some contactcleaner to clean the thing and try again...

1009. Hmm, I forgot the file and sent another post with it, not up yet

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-15 23:40:46 UTC
From: Sean Whalen <whalens@home.com>
Message-ID: <20hb8.48969$X64.16550245@news1.rdc2.pa.home.com>
Source record: 31230

It's possible this newsgroup doesn't accept attachments I suppose. Well,
the link for the file's here if my post doesn't show up:

ftp://ftp.spudster.org/pub/atari/cth/games2/atr/q/questron.zip

But I said, don't worry about it too much, because:

A) I rarely have time to play these games anyway, I'm doing this more as a
collector and the rare chance I might get around to playing these games
again. :)

B) It's emulation, and it's not perect. As I said I already have these
games working on other emulators, even though NeverEndingStory has garbled
graphics on Act 3 a bit, it's a text game primarily.

C) And I mean no offense at this, the Atari 8-bit "community" doesn't seem
to be that big (from what I can tell compared to other communities), and
most seem to be interested in 90s games or games I never even heard of in
the 80s which sound like action games to me probably with thin plots.

1010. I had some thoughts on broken disk images

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-16 00:03:55 UTC
From: Sean Whalen <whalens@home.com>
Message-ID: <Llhb8.49046$X64.16563037@news1.rdc2.pa.home.com>
Source record: 31231

I was wondering, would it be possible to make a database program that included a working list of known programs, and maybe scan what you have and compare them? Maybe something to do with the "blocks" in the disk, see if they matched up, including ones that have been altered by patches, cracks, that work. I don't know, I'm not a programmer. Also maybe just a way to scan the "blocks" to see if they're valid, but I read somewhere they change because of patches and cracks and all. I'm no expert, but it certinately would save a lot of frustration and time if one site had all working and tested disk images instead of some broken ones and you had to go to another site, which is difficult because some games like Questron seem rare, at least search engines like Google can't find them. I can't even find Penguin/Polarware's Quest, I'm playing the C64 version. Including sites to download the games would be great too. Maybe some people in this "community" could work together on it? Just some thoughts.

Good luck with the walkthrough for Hacker. From what I understand it's a
little different everytime. I have an original as well but it's
copyprotected and the best I could do is a PRO image for apeloading through
an SIO2PC.

Yes, I heard that. But it was the same in both the C64 version and Atari version I played. You buy stocks and bonds in NY, and give that to Japan. Then you buy the pearls and camera, you give the pearls to China. China you buy the jade carving. You offer that in Cuba.. In UK you give the camera, and you buy the Beatles LP, and then you give that to California. Then you go to New York for the end. That's how it worked in both the versions I played anyway, I made it to the end in Atari, it just crashes as you try to display the newspaper.

You can upload them somewhere and post the link, or email them to me at nospam@whalens@comcast.net, remove the nospam to reply. Hope that trick works. I'll try to test them when I get around to it, no promises though. Otherwise there's not much point in my posting here anymore.

1016. I think I'm unsubscribing from this group anyway

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-16 06:44:06 UTC

Message-ID: <Wcnb8.49586$X64.16824737@news1.rdc2.pa.home.com>
Source record: 31237

I found the games I asked for already for other emulators. You can't stick to one computer when you're using an emulator. Let's face it, people are too busy to test the games anymore, not a complaint more of a fact. Even I am pretty busy with one thing or another. And most of these post seem about the Atari as a computer itself, which I don't have anymore and have no desire of buying again. I don't have the space, and I'm not sure it's worth the money. And I'm sure the parts would keep breaking down. So, take care everyone, good luck with whatever you do. :)

It just occured to me that maybe the version you have is for an XL and
you're using it on a regular 800. The 'newspaper' scene may be in an
unsupported graphics mode.

See my imid program, I think it does what you've described. But it's
unfinished - mainly because of lots of work.

> the DAT...

I wrote it many times - romcenter and such tools are good just for rom images. Catalogizing disk images by them is completely *CENSORED* and leads
to *CENSORED* collections - TOSEC is good example.

Identifying disk images by their length and 32bit crc is *CENSORED* and will not give any useful results. [alt] is nothing than a lie - usually there are no [alt] versions, just different images - as there is no one-and-only-way how to create atr, except for doing unpatched pro image.

Tell me, what will you get when you 'convert exes to atrs'? You'll simply create tons of new & different-than-before atrs. If you want that, I could
create for you 2^1024 images of one game without any problem. And if that's not enough, I could create 2^2048 or you want 2^8192 or even more?

Also, it should be no problem to create images of two completely different games having been identified as one game. Would you like that?

And do you really want to identify all of the possible combinations of games on multiboots?

Where are you in the UK?

I'm in the outskirts of London so i can speak for this area, but elsewhere in the UK i'm afraid not.

There are 2, maybe 3 shops in London

The Notting Hill Computer exchange is the maybe

Retro X (shepards bush, they do have a web site, do a google search for it)

The Computer Exchange (the big computer exchange/parts chain) have a retro basement at their Rathbone Place (Just of Oxford Street, Tottenham court road end, behind the Virgin Megga store).

All places i have seen carts. Be warned, The Computer Exchange place is optimistic in its pricing! Boxed, as new cart, £20 in some cases. Loose ones with no instructions etc, about £5 (sold as seen). Retro X are more resonable, however they are explicitly 'sold as seen'

You also have auctions through Yahoo.co.uk which are less frantic in their bidding.

Hope that helps

Source record: 31243

1. there are people who devote their time to gathering, organizing, and testing games for the Atari. Check out Holmes site: http://homepages.paradise.net.nz/atari/ its one of the best and is added to regularly. I've been in contact with the webmaster and you can expect many new updates soon.

2. As far as space goes, a 130XE or 800XL takes up very little space. You can just tuck it away on edge somwhere on your desk (like next to your monitor) when its not being used. You can use an aimslab Jam! device or equivalent to use your existing VGA PC monitor as an output device for your Atari. Then eliminate the disk drive by using an SIO2PC cable, and use your PC for storing the disk images. I bought my Jam! for $25 on ebay and built my own SIO2PC cable for about $10.

3. By eliminating the monitor and the disk drive, all the usual points of failure are taken care of. I've never had one of my Atari computers break down yet, and my 800 is close to 20 years old. Of course I've been through many, many disk drives and monitors though.

4. As far as price, my favorite machine is a mint 1200XL which I bought four years ago from a thrift store for $3.99. I have no doubt that it will continue running for many, many years to come. There are many good deals on ebay. Its not too expensive to just buy "standard equipment". The high prices are found in the rare carts and games, and "mint in the box" stuff, as well as disk drives and more rare hardware.

just my 2 cents.
-Dan

Keep away :-)

As you say, they are DAMN expensive...

You can buy a whole system from a boot sale cheaper than you can buy a
single cart from them.

Date: 2002-02-18 03:46:01 UTC
From: ronfucci@bellsouth.net
Message-ID: <3c70780f.52553908@basic.bs.webusenet.com>
Source record: 31157

I have a Percom drive that boots up OS A+. If I then shut the drive
and my 130xe off and restart all right away, I get boot error.... If
I then turn all off again and wait about 10-15 minutes and restart, it
boots.

Any idea if there is a failing component in the drive to cause this ?
I've tested this same sequence in other drives, e.g. an Indus GT and
the GT boots every time.

Tks.

Hi

I'm aware of problems identifying console roms with romcenter. The crc
method is good for arcade roms, you're right. I'm actually developping
a new way to handle these consoles dump. It is also based on crc, but
only crc of the pure game binary. All header, footer, boots... will no
be taken into account in the process of crc calculation. This way, one
game means one signature, and one signature means one game, whatever
you do with your file.

If you have concern or though or idea, or want to help, please mail
me.

Foreign software works.

On the Atari 400, 800, XL and XE computer series,
makers of software (and Atari) did not put restrictions
that limited software products to regions.

Hi Ron;

Do all versions of DOS behave similarly? Any read/write issues immediately
prior to the reboot?

My AT88-S1PD master acted like that some when I 1st received it and I was
cursing eBay... I gave it a pretty thorough cleaning inside the case and
aimed a small fan at the rear panel whenever the power strip is active. It
might be coincidence, but has been reliable. I still have the odd write
failure due to a flaky write protect diode.

Ok thanks for the replies. Does this mean that games like, say 2049 and defender are exactly the same roms in the states as they are in blighty. They haven't been changed to cope with pal and NTSC like they are with a playstation.

Software and docs from OSS are copyrighted, so just putting it online is
not legal. I have made several attempts to locate OSS founder Bill
Wilkinson, but haven't been able to get valid contact information.

Yes - you will get 'borders' at the top and bottom where the
resolution has been padded out to a full pal screen. Also, if the
game was syncronised to the VBI (ie: screen refresh rate) it will be
about 10% slower on the PAL system.

And as has been noted, some games which used a technique called
'artifacting' to achieve extra colours in 320x200 mode will not work
properly on PAL displays (they look black and white).

I don't think it is possible to make a fullscreen 'PAL' game .... as
far as I remember the extra blank scanlines to fill out the screen
were added by the hardware and as you start to add visible lines, the
screen starts to roll.

Well,
the raytracing demo in TB contains pics and TB code. The pics are
converted Degas pics (b/w or 4 colors - I do not know for sure, since
the demo does not work on my CS RD). The turbo Basic code are 3-4 Tb
programs, think they can be changed easily - if you know how to program.
since I am not at all a programmer, I cannot patch/change the code in
such a way that the demo works on my RD. but surely someone can do
this... -Andreas.

P.S.: If you are interested I can mail this demo to you...

From: switchblade <xxx@nospam.com>
Message-ID: <33wc8.4827$vr.88825@news.easynews.com>
Source record: 31175

Anyone know where to get a cable for connecting these up. Do all Atari 8-bits have the same monitor connector pinouts, or would I need a separate one for 800xl and one for 130XE. The CM8833 has a SCART RGB connector as well as its own DIN type connector...

Does the XL/XE output in RGB or is it composite?

Anyone know of a place to buy these cables or will I have to get a soldering iron, connectors and cable?

> more?

By using what appears to be a standard conversion program to convert from a .exe to a .atr file, then it is easier to reach the (probably never-to-be-reached) goal of having all Atari 8bit programs in one single, easy-to-manage format. Currently there are tons of "raw" .exe files floating around, along with obviously countless multiboot disks. Many have already been converted to .atr format by someone else, some haven't. Do you really need to have five different copies of the same program? Probably many of the Atari 8bit archives do - in .atr format (as a K-Boot conversion), .dcm or .xfd (again, a conversion), as a raw .exe, and existing on several different multiboots. Wouldn't it be nice to have that just once, in an .atr format that is easily usable with any emulator or with APE?

> Also, it should be no problem to create images of two completely
> different games having been identified as one game. Would you like that?
>
> And do you really want to identify all of the possible combinations of
> games on multiboots?

I am very specifically not going to touch multiboots, the plan is to extract all the executable files, convert to K-boot images, then name them that way. Again, the ultimate goal is to have all Atari images in a single format, and to have a database that can look at a big pile of .atrs and give them meaningful names. (I'll clarify saying that I'm avoiding multiboots and also point out that I'm avoiding images that have multiboot boot sectors and just one .exe, or an image that has just DOS and a .exe - those should all be K-booted and dealt with that way.)

To say that the CRC renaming is useless is just main wrong, and your whole attitude is pretty damn lousy. How about this:
People just keep their own collections, you download files with short filenames that are often incorrect, you keep tons of duplication, and you have no idea what is on any multiboot disks, and you're looking for a Synapse game but good luck because you have no easy way of telling who made what... "Would you like that?"

I'm not forcing anyone to do anything, and I do feel that what I'm doing will be helpful to the Atari 8bit community and hopefully might encourage some more folks to dump games that are still missing. (For example, I can only find 3 of the SAGA adventures on the net - I've got another on floppy but haven't dumped it yet. I also dumped disk one of what appears to be an undumped-before Crystalware game, but disk two was corrupt. Hopefully someone will see that and miss in the missing parts.)

Point being, I'm trying to do something helpful (and spending many, many hours on it.) If you don't like it, then ignore me, but don't flame me for it.

This is more or less exactly what I'm working on, as a volunteer with
TOSEC (The Old School Emulation Center) - tosec.retrogames.com.

I'm collecting all the .atr images I can get, converting all .dcm and
.xfds I can get to .atr, dumping new stuff, and eventually will try to
convert the single executables (which are almost always cracked
versions of the original full-disk images) to .atr images (which
others have done already to many of them)... Then those .atr images
are renamed according to a standarding naming convention, which
includes the name of the program, the year of release, the company
that released it, and (optionally) a ton of other information - the
language, the video system, the disk #, if it is a bad dump, if it's
cracked and by who, if it's "trained", if it's hacked, etc, etc. For
example:
Seven Cities of Gold (1984)(Electronic Arts)(Disk 1 of 2).atr
...is a simple one.
Speed Hawk (1988)(Atari UK)[cr Mr. Bacardi].atr
...indicates that this is a "cracked" game, by Mr. Bacardi. (A number
of games have images for different cracks, or uncracked.) Other info
can be added, like:
Zipper Pinball (1984)(Small)[made with PCS].atr
I added a "made with PCS" on all the games which were merely homemade
Pinball Construction Set tables.
Final Flight! (19xx)(MMG Micro)[OSb].atr
This indicates that I couldn't find what year it was released, and
that it requires OSb to run.

Once this is done, "DATs" are created for use with the "big 3" ROM renamers - ROM Doctor (my personal favorite though it is very rarely updated), ROMCenter, and clrMAME, as well as TOSEC's own "TUGID", which has visions of doing much more than just renaming. Anyways, these renamers can take a look at your collection of existing images and rename them to the more descriptive names, as well as identify duplicates, seperate the unknowns, etc.

From what I've found, there are actually very few "bad" images (though they certainly do exist) but many need specific settings - the renamed files indicate that, so some filenames will include [OSb] and/or [Basic] - meaning that they require the OSb version of the OS or Basic or both to run.

Obviously not every image is tested through to the end (the problem with "Hacker" that someone mentioned probably wouldn't be found) but if there is a problem, it can be noted and updated in a future version of the DAT.

The current Atari 8bit DATs that TOSEC provides have got a lot of errors and duplication (I don't know who did them), the first release of the new Games DAT that I've been working on will probably be coming soon. (Also note that TOSEC does NOT distribute the ROMs, it's up to you to find any "missing" images that you want.)
The other part of your question is probably due to the fact that there is still a huge amount of undumped stuff, as far as I can tell. No way to correct that but for people to keep dumping their stuff!

I believe the SDTK was two two-sided disks full of the files needed to construct a boot Dos diskette for almost any Atari computer. It originally contained version 1.1 for the 400/800 series and v. 2.3 for the XLs plus a game loader menu and all of the .COM files to accomplish the tasks found in Dup.Sys of Atari's 2.0.

There may have been a Library.Equ equates file on the disks for entry points, but most of what you needed for writing your own utility files was the explanation in the manual of passing parameters and parsing buffers and how to use internal pointers to important data.

All 8-bit monitor jacks are pretty much the same except missing on 400 &
most 600XL and one missing signal on 800XL; they are not RGB, just composite
and separate luminance and chroma similar to S-video. Thunderdome has the
pinouts for constructing cables or many C=64 types are compatible.

I bought the monitor cable for the XL/XE from B&C Computers. Just goto
the site: http://www.myatari.com/. I have used this cable along with a
video converter to connect my XL and XE to a SVGA monitor.

I'd love to have a copy of this disk and would be willing to pay for it (within reason) on an ATR or floppy but it sounds from the posts here that it's getting hard to find the people who actually own the rights to this kind of stuff. Anyone know how to contact FTE? Anyone on the ng affiliated with, or better yet the owner of FTE? If there aren't macros already, it sure sounds like there is an opportunity here for me to write some given the right documentation, and to learn something in the process.

Exe is as easily usable with APE (try PC mirror).

Regarding the conversion - I simply hate when somebody takes cart image,
converts it to boot image, somebody then converts it to exe because of
dos-load and then somebody takes K-boot and creates boot again.

> To say that the CRC renaming is useless is just main wrong,

(Monty Python Quote): No, it isn't. It's good for ROM images. Not for
disk images. For example Zorro - I've got 10 different images - which of
them is the one and only? Is there such? Are others [alt]? Also, you
simply skip some images and that's wrong.

What about 'player' disks? You play the game and your hiscore/player
settings are saved to the disk. Will it be 'new/unknown'? crc32 just
says if two binary files are _PROBABLY_ same. Do you really think that
disk image is different when the high score is different?

> People just keep their own collections, you download files with short
> filenames that are often incorrect, you keep tons of duplication, and

> for a Synapse game but good luck because you have no easy way of
> telling who made what... "Would you like that?"

I have now 2387 games, no dups, no multiboots, no kboots. I've got also
'by company' lists. All of that without touch of TOSEC and dumb-crc
approach.

> I'm not forcing anyone to do anything

I'm I?

> (For example, I can only find 3 of the SAGA adventures on the net - I've

I think all SAGAs (1-6,13,B.Banzai,3xQuestprobe) were dumped years ago.

> I also dumped disk
> one of what appears to be an undumped-before Crystalware game, but
> disk two was corrupt.

Any of these? Bermuda Experience, Clonus, Clonus II, Haunted Palace,
House Of Usher, Land of Sumer, Laser Wars, Little Crystal, Pioneer
Experience, Treasure Island, Waterloo II, Zardon

> Point being, I'm trying to do something helpful (and spending many,
> many hours on it.) If you don't like it, then ignore me, but don't
> flame me for it.

I just pointed out that supporting TOSEC (from my POV) is just waste of
time. It could be managed in an easier way without the horrible naming
scheme.

Hi,

Yet another message :) I've seen a few 400/800 machines on EBAY. Are there any other places which are good sources of these machines in the UK.

Cheers

1065. Re: where to get 400/800 carts in the uk ?

Iï¿½m in Germany , but I have most of the XE carts , new , for 10 Euro
each.

Some even cheaper (Ballblazer , Millipede).

Donï¿½t know , but some people try to sell them for 30 or even 40 Euros
, thatï¿½s too much.

The postage is not very high in Europe , so you may buy some of the
games.

Goto Radio Shack and get a can of the spray TV tuner cleaner. It's a combo of alcohol and mineral oil in a suspension. Open up the cases and spray generously while twisting. Close it all up and dry the outside off and you're ready to KABOOM!
Mo

I like what TOSEC's planning. I think it's about time somebody organized all
of the archives and gave them a standardized format. There has never been
this much disorganization in the TRS-80 archive world and the commodore
archives seem to be fairly organized as well. I think the longevity of all
of this software depends on some sort of uniformity.
Thanks TOSEC!
Mo

This is the main problem for every systems, computers, console and
even arcade where bad dump are often discovered. But, there is only
one version of Zorro sold. So why should we have 10 differents dump ?

The correct way to analyse dump is taken from emulators.
1 - Locate the main code dump (this is the code executed by the
emulators)
2 - Calculate the crc of this code
3 - Compare crc to a reference list.

The main problem is of course the point 1. If you choose a default
file format, this appear to be really easy.

If you have different crc for the main code, you have to both
cartridge to detect differences, or analyse differences in files to
find which one is the correct dump (and delete or mark the other one
as bad dump).

These settings should not be included in dump ! A dump is a clean
extraction of the cartridge rom, or disk files. No hack, no
signatures, no hichscore.

Anyway, if you extract the core code of the cartridge, highscore
should not be included in it.

This is a very promising source for building a clean cartridge
database. Keep them safe ;)

Since it looks too much like Jindrich against everybody else I feel the
need to change the balance somewhat. IMHO since recent emulators are
able
to load .exe there seems to be no more reason for things like 'K-Boot'.
For me it looks like there should be four formats :
.atr for disk images
.exe for file images
.rom or such for cartridge dump
.cas or such for tape images (perhaps .tur for turbo tapes too ?)
They _are_ different things. Conversion of .cas can make sense,
conversion
of .exe to .atr never.

> > > Do you really need to have five different copies of the same

That is a serious problem since it takes a lot of time to identify which
version can be safely thrown away.

For cartridges you're right since there cannot be a highscore in a
cartridge
dump. But e.g. boot disks are a different theme. It's quite normal that
programs stored scores etc. on the disks. Therefore it's quite some work
to delete them from the disk image and who knows what presets there
where
on the disk when it left the factory ?

Seems like we (and maybe dozens of others) did quite some work in
parallel like e.g. extracting lots of exe's from multiboots and
identifying
multiples then.

> This is a very promising source for building a clean cartridge

Forcing me and most others that (still) don't use windows to use a
windows PC to rename the files before transfering it to the target
computer (especially the blancs are a real and unnecessary pain) :(
That's why I, old fashioned as I am, use file names that are usable on
any computer and put all the information to a separate (ascii !) file.

Since the screen refresh rate for NTSC is 20% faster, it'll be 20%, not 10%.
10% wouldn't even be noticeable to most people, anyway.

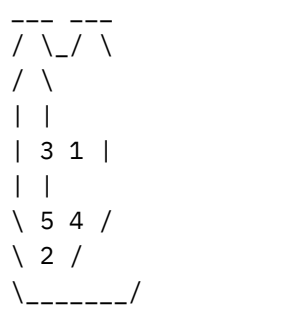
Building a cable is very easy. If you know which part of the soldering
iron is getting hot, it should be no problem :-)

Here's the pinout of the monitor jack on the back of your Atari:



1... luminance
2... ground
3... audio
4... composite video
5... chroma (not available on stock 800XL)

If your monitor supports composite video (usually there's a yellow
cinch connector for that, but there's a good chance that your monitor
also accepts composite on the SCART connector), just use pin 4
(composite video).

If you are up to more soldering fun (and a better picture) go ahead
and build a super video mod for your 800XL and connect your monitor
with pins 1 and 4. I'm not sure if your monitor supports S-video
input, usually that's done with a 4-pin mini-DIN (aka 'Hosiden')
connector - but it could also be that your monitor accepts S-video
on the SCART connector. (I'm not sure about that, but IIRC the XE
series will output S-video (chroma) without a mod).

BTW: if your cable is not longer than 3-5 meters, you may use
standard 'audio type' shielded cables. I've used them for all my
cables so far (up to 5 meters), mainly because its almost impossible
to get thin 75-ohm video cables - and the (thick) standard RG-59 is not
flexible enough IMO.

so long & happy soldering,

Hias

> iron, connectors and cable?

It's composite.

The CM8833 is a great monitor. I'm using one. It can even handle stereo.

Either go to http://www.abbuc.de/shop/index.html (the site is in German, but that doesn't have to bother you. They speak english too.) click on 'hardware' then scroll all the way down. The Euro is about 90 dollarcents IIRC.

Or go to your local electronics store (where they sell the stuff you mention above) and either buy the stuff to do it yourself or get yourself a cable that looks like a 5 pin DIN connector on one site and 4 RCA/Cinch connectors on the other side. (or connect two cables to get the ends you need. That's what I did.) 2 RCA cables will probably not work as the change of those two being the right signals are slim to none. With the 4 RCA/Cinch connectors (look at the back of your stereo to see what they look like), you're sure that two of those 4 contain the right signal.

If you buy a SCART to RCA/Cinch cable, make sure the right cables are connected. There can be up to 6 RCA/Cinch plugs connected to one such cable.

BTW RCA are what these things are called in the USA and Canada, in Europe they are called Cinch or Tulip connectors. They should fit inside the two left most connectors on the back of your CM8833.

Emmanuel Fernandes placed the schematics of the CM8833 that I scanned on his server. I thought I had that URL, but it must have somehow disappeared.

So you don't have countless duplicates.

>> Currently there are tons of "raw" .exe
>> files floating around,
>
>What's wrong with exe files?

Nothing, except many have already been converted to .atr format. Why
should I have a copy both in a raw .exe, in a multiboot images
(probably several), and in a K-boot conversion that someone already
did? For Joe Sixpack who doesn't know everything about the Atari (as
well as the old-time Atari user who just wants to use an emulator, or
a real one with an SIO2PC cable), it's far easier to worry about just
one format, especially when the standard emulator makes it so easy
just to double-click an .atr file and run it. (Remember the acronym,
too - TOSEC is about making it easier for emulation.) Obviously this
won't hold true when it comes time to do applications - I can't
decided on the best route for that, for example DiskComm - release
just the .exe, or a disk with just the .exe, or a DOS disk with just
one file on it... I'll have to look into that.

>> Do you really need to have five different copies of the same
>> program?
>
>How do you know if the images are different or if the program is
>different?

See above - by putting them all into a common format, the tools that
TOSEC provides can almost instantly detect identical images.

>> Probably many of the Atari 8bit archives do - in .atr format
>> (as a K-Boot conversion), .dcm or .xfd (again, a conversion), as a raw

>Exe is as easily usable with APE (try PC mirror).

But only in 8.3 names (which will never be enough), and as I said,
TOSEC is mainly concerned with emulation. It's certainly easy enough
for someone else to re-convert the K-boot disks back to exes and make
some mondo multiboot disks, but that's not my concern. It is possible
that in the future, I will break out the K-boot conversions into a
seperate DAT to make them easier to track.

>Regarding the conversion - I simply hate when somebody takes cart image,
>converts it to boot image, somebody then converts it to exe because of
>dos-load and then somebody takes K-boot and creates boot again.

I can certainly understand that, and that is not my intention. I can't
say that it won't happen, but if I can avoid it, I will.

>> To say that the CRC renaming is useless is just main wrong,
>

>disk images. For example Zorro - I've got 10 different images - which of
>them is the one and only? Is there such? Are others [alt]? Also, you
>simply skip some images and that's wrong.

This is the problem with Atari 8bits more than any other system -
very, very rarely will ANY .atr file be the one and only, except for
converted tapes or cartridges. Virtually everything has protection,
even the small-name stuff like Meteor Storm (which I have on an
original and I don't think I've seen in any cracked format.) Until
emulators start handling .pro files and people start dumping/sharing
them more, most all .atrs will be cracked or hacked. What I am doing
is marking which is cracked, or hacked, or trained, and by who. If
they appear to be absolutely identical, I mark them as [a] - in the
future, I may take more time to examine the directories to see why
they're different. Obviously the biggest culprit are games that would
save data to their own disks, in which case it's a matter of finding
something close to a blank one, and once that's done, refusing to
rename any ones with saved games on them, and removed any existing
ones from the DAT.

And, I'm not skipping ANY images, the TOSEC method specifically
instructs to, when all else fails, put a ZZZ-UNK- at the beginning of
the filename, indicating that yes, we know it exists, but no, we don't
know what it is (and any help would be appreciated.) Often they are
dumps that are so bad that it's difficult to figure out what they're
supposed to be without going in with a sector editor. (Which again is
not something I'm going to do right now - I'm still working on getting
the .atrs that I do have into the list.)

>What about 'player' disks? You play the game and your hiscore/player
>settings are saved to the disk. Will it be 'new/unknown'? crc32 just
>says if two binary files are _PROBABLY_ same. Do you really think that

>disk image is different when the high score is different?

Yes, I do, actually. However, it's possible that there will be a move
to a longer CRC in the future, I understand that there has been one
case of duplicate CRCs encountered in one of the TOSEC DATs - and
considering the many tens of thousands of files in there, that's not
too bad (but still something that needs to be taken care of.)

>I have now 2387 games, no dups, no multiboots, no kboots. I've got also
>'by company' lists. All of that without touch of TOSEC and dumb-crc

So fine, don't use TOSEC.

>> got another on floppy but haven't dumped it yet.
>
>I think all SAGAs (1-6,13,B.Banzai,3xQuestprobe) were dumped years ago.

When I say SAGA, I'm mainly thinking of conversions of the original 13
Scott Adams Adventures. Anyways, I misspoke, I have 1-5 and 13 but not
6, and I had a floppy with #6 but it turns out I had overwritten it
with some other files way back when. (It's always an adventure finding
the stuff I used to have!)

>> I also dumped disk
>> one of what appears to be an undumped-before Crystalware game, but
>> disk two was corrupt.
>
>Any of these? Bermuda Experience, Clonus, Clonus II, Haunted Palace,
>House Of Usher, Land of Sumer, Laser Wars, Little Crystal, Pioneer
>Experience, Treasure Island, Waterloo II, Zardon

Haunted Palace. Disk one appears to be perfect, and I had it in
DiskComm format. Disk 2 failed. I just started using DiskComm to
convert all my old floppies one by one last night (instead of manually
copying the files over) so I may re-do that disk, since DC will
probably give me one with everyone but that one sector, and perhaps a
sorta-functional disk 2 can be created... not perfect, but better than
nothing.

>I just pointed out that supporting TOSEC (from my POV) is just waste of
>time. It could be managed in an easier way without the horrible naming
>scheme.

Well, that's your opinion - I think the naming scheme (the current,
1.0 revision - the older TOSEC DATs like the Atari 8bit ones do not
follow any naming convention and are pretty junky) is extremely

well-thought-out and effective, and many others do, too.
Anyways, as I said, it'll likely be released soon. If I get my second update in in time, it should probably be complete enough to recognize the majority of the .atrs floating around in the usual locations - but only games, not demos, utils, etc.

Well, TOSEC just creates the DAT files. Currently, my understanding is
that Romcenter, ROM Doctor, and clrMAME are for Windows only, so the
trick would be convincing one of those developers to port to Mac,
unix, etc. Anyways, that's all out of my range - I just volunteered to
help clean up the Atari 8bit stuff, I have no hand in any other TOSEC
work and am certainly not an "official voice." They do have a message
board set up for suggestions, etc, and you're certainly welcome to
make any suggestions there.

However, I still don't see how I'm forcing anyone to do anything - you
are certainly free to ignore any of the work I've done and I won't be
offended. :) Just keep using your files the way you are now, the only
request would be that if you have something that no one else does,
share it - but that's a general request, nothing to do with TOSEC. :)

Well, as I say, I may, in the future, split off the K-Boot images into
a seperate database, which would make it a fairly trivial task to
convert them back to .exes, though of course you'll lose the long
filenames in the process... which is the main benefit that I can see
to having them in ATR format anyways. (The emulator or APE don't care
if you have a disk image with a 60-character-long filename, but the
Atari does.)

>That is a serious problem since it takes a lot of time to identify which

Well, I've been spending many hours on this problem. At this point,
I'm not prepared to throw ANYTHING away.

>Sounds like a job for life to me.

Well, that's what I've volunteered to do, but some of it is
impossible, since so many .atrs are cracked/hacked, there's little way
to know what is the "true and correct" dump.

>For cartridges you're right since there cannot be a highscore in a
>cartridge

>programs stored scores etc. on the disks. Therefore it's quite some work
>to delete them from the disk image and who knows what presets there

>where
>on the disk when it left the factory ?

Well, I don't think THAT many games stored the highscores on their own floppy - but regardless, the games that do will probably be impossible to find in their original, unmolested condition. So, we do the best we can do. If the game image, by and large, appears to be identical to another copy of the game image, it's marked as an [a] - if you want to have a "minimal" collection, use a quality file manager (not Windows Explorer), select every file with a "[a" in it, and delete it. Bad dumps might be slightly trickier as "[b" will also pick up "[Basic]" as well as "[b]", and selecting "[b]" will slip any "[b2]", "[b3]"... hopefully a future version of one of the renaming tools will be able to automatically remove the bad dumps from your collection the way Cowering's "Good Tools" can now.

>> > I have now 2387 games, no dups, no multiboots, no kboots. I've got also
>> > 'by company' lists. All of that without touch of TOSEC and dumb-crc
>> > approach.
>
>Seems like we (and maybe dozens of others) did quite some work in
>parallel like e.g. extracting lots of exe's from multiboots and
>identifying
>multiples then.

Yes, but why duplicate work? Doing all that renaming in association with TOSEC means that other people (who don't have the time to do through their collections themselves and organize them) can enjoy an organized collection, also. It's also very helpful for someone (like me) which is also dumping their old floppies into .atr images - they can be run against a renaming tool and any duplicate disks can immediately be removed, so that you're left with only the unique stuff, making the organizing process much easier.

Hey, folks, I'm not saying that the system is perfect and that there aren't challenges to work out, but that's no reason to say that no one should bother. I have, I'm having fun working on it, and as a result, I've got a collection of .atrs with very descriptive names, and I'm fairly proud of the work I've put it to get it to that point. I certainly fail to see how it could do any harm to the Atari 8bit emulation crowd (for whom it's intended) and hopefully, by having a current, updated DAT, it might even get some folks to be inspired to play again, or maybe dump some of their collections that they have in the closet.

I have a boxed Atari 800 with tapes/disks and some carts that you can
have for free if you pick it up from Woking in Surrey. There's no tape
of disk drive though.

Let me know if you want it, I need the room and hate auctions.
Remember to de-mung my addy though.

I remember another Activision game that seemed to have bugs: Pitfall II. I think there was more than one obvious bug in that game, but one that I come to think of was graphics on erroneous locations, or incomplete graphics.

Can you, Andreas, or anybody reading this confirm that there were bugs in Pitfall II, and maybe also tell if the bug was related to an incorrect implementation of a copy protection function? (Probably not.)

Anders

And if you remember you can't hold it like a pencil... (believe me, after a while you'll start to smell the toasted flesh and then you'll notice the pain!)

BTW, there are some video cables for sale which already have that configuration (a 5-pin DIN connector on one end, and 4 RCA connectors on the other), so if you don't want to have to solder you can get one of those and then find out which color (every RCA connector is colored differently, black, white, red and yellow) corresponds to which pin #.

One thing I should point out is that in many cases (i.e. Epyx) the disk version of a game and tape version were signifigantly different. So maybe keeping CAS, ATR, and ROM files seperated would be a good idea. Another thing, these ATR's should be checked for hidden text files giving credits for a hack. I've only cracked two games and when I did instead of inserting credits into the game, I hid a text file on the ATR called 'greets.txt'.

That's why, at this point, nothing is being discarded, and apparently similar files are marked as alternates. If it can be verified that one is a dump from a cassette or cartridge, it will probably be marked as such in the future. (Currently, it should be fairly easy to tell, as a true disk image will be 90k, most any conversion will be much smaller.) Currently I just want to finish getting the available .atrs organized with names and the other necessary data, and in later revisions, more time will be spent with extra comments such as [tape], [cart], etc.

I would be totally in support of the idea of keeping them seperate except that there's already so much duplication between the different formats... it's quite possible that the ATR Games will be further split into "ATR Games - Disk", "ATR Games - Cassette", "ATR Games - Cartridge" etc, then the various formats will be seperate and easily convertable back to the original format... but realistically, when someone is looking for a particular game, who wants to have to check three different areas? I think it might make more sense to keep them together and just have descriptive names, like:
Choplifter (1980)(Broderbund)
Choplifter (1980)(Broderbund)[tape]
Choplifter (1980)(Broderbund)[cr NAPO][file]
Choplifter (1982)(Atari)[cart]
...etc. (That info's off the top of my head and almost certainly wrong, I'm just using it as an example.) This allows everything in one place, but still clearly differentiates between disks (the default, no comment given) and alternate formats (tape, cart), as well as cracked versions and file conversions.
(Note also that TOSEC naming convention specifies adding a (!) when the image is absolutely, positively the correct one, so there is way of setting aside what is definitely the correct dump.)

Ideally, it would be easy for someone to grab all the file conversions, or carts, or cassettes, and seperate them and convert them back to .exe or .rom or .cas or whatever, that info isn't there yet but hopefully in a future version... which would (with any luck) be a solution that, if not absolutely ideal, with make everyone at least content, and still avoid endless duplication of identical images, and allow a newbie playing with an emulator to only have to

worry about a single extension and still be able to play everything.
(Of course, the single extension goes out the window if/when
Atari800Win starts supporting .pro images!)

Good point, I will make sure to check into those things as I get more
time to add more info to the existing names. Thanks for the
suggestions!

Hi Mathy,

I mailed to the technical support of National Semiconductor to get the
datasheet of the NS405-A12N and the mailed me within 3 days the pdf
file.

If you like to post it on the web, I would suggest to get the permision
of NS.

I'd look at the power supply. Probably have an aging capacitor, diode, or
voltage regulator that
needs replacing.

<snip>
: What's wrong with exe files?

This is what I'm wondering. Emulators (err... at least 'Atari800') can
load and run EXEs without even the need for a DOS disk image.

So, I can do:

atari800 -small -pal -run somedemo.com

And it loads and runs it. No disk images involved. No need to remember
'now, which ATR contained such-and-such file?' and no wasted bytes.
(Disk images are /usually/ at least 92K a piece. What waste for 8K files! ;))

I agree 100% on the multiboot stuff, which is why I plan to totally ignore them as an image. The plan is to extract every .exe from every multiboot I can find, put them in .atr format (for reasons that I'll mention below), then rename them.

I'm planning on sticking with .atr because...
1) a single format is easier on those new to the Atari...
2) Simply double-clicking the file will make it run in Atari800Win (easier than typing out a command line string, or doing File, Load Executable, and browsing for the file)...
3) Already much of the files are in .atr format, and it's easier to tell the emulation user to convert their .exes, etc, to .atr format than to tell them to find all their k-boot conversions, convert them back, and delete the originals, as they won't be indexed any more.

As for size, the MakeATR program produces an .atr that is only a tiny bit bigger than the original .exe file... much, much smaller than 90k in most cases.

So, when all is said and done, each .atr will have one and only one game on it - no guessing if it's worth downloading that mysteriously-named multiboot that may have one game you need on it. :)

go to the webpage www.omnitrend.com

call the phone number below!

They have some still shrinkwrapped Universe I for atari 8-bit for sale. I used to play this all the time! It has the manual and all that stuff! Get it while it lasts.

Now the bad news. The price is still the original 1985 price of $69.95

I ordered mine today. I have the XEGS system and now I may buy 2 1050 diskdrives to play this, or just use the emulator. But you can't play this without the docs which is the main reason I decided to buy it.

1104. Need help with Atari 130XE

Hello, I have an Atari 130-XE and 1050 drive that I've been using since the late 80s. They've always worked great, and I've never had any problems with them. However, when I went to turn it on today, it took me to the memory test screen and wouldn't read any cartridges or disks. It wouldn't even give me a "BOOT ERROR!" message (the disk drive was turned on). I went through and checked all the connections and everything seemed to be working okay, and I looked in the user guide under troubleshooting but it didn't have any valuable information. Does anybody know what could be wrong? Could it have just died all at once? The last time I used it was about a week ago and it was working perfectly.

Any input would be greatly appreciated!

Thanks,
Hulsie

Depends on what monitor/TV you're using. A picture-tube never displays the full screen. All four sides are capped, but when using an older TV with regular display-settings, you can fill-up the whole screen on a PAL system with a bit of overscanning. Too much overscanning and the screen indeed starts to roll...

Yeah, I remember the 3-ring binder. I now have the complete Universe
collection.

Universe I on Atari 8-bit

Universe II on Atari ST

and an RPG similar to ultima, Universe III on IBM PC.

1110. Re: Paddle Controllers

Hi there,

The atari paddles are basically a potetiometer internall so those can get dirty wipers / contacts. what you could try is getting a can of electrical contact cleaner from a local electronics parts store (no I don't really mean a stereo shop, they may not have it more often than not). Just unscrew the controller case, spray inside the potentiometer (not just the inside plastic but just into the pot) then close it up and try it out. could try just one pair of paddles to see how it goes. WD40 might work in a pinch but its not as quite as safe on the plastic or rubber parts (might cause it to warp a bit)

>No, I don't have a better solution myself, but just wanted to let you know...

Well, yeah, that is a problem... I don't see any possible way to get
them well organized when stuck with 8.3 filenames. I had enough of a
problem "way back when" trying to keep everything straight! Most of my
game EXEs I used one of the multiboot boot sector programs ("Fenders"
was my personal favorite) and treated everything like a single
11-character name instead of 8.3...

Anyways, the benefit of having .exes converted to .atrs will be that
you will be able to use them easily with APE... since the Atari thinks
they're a full disk image, it couldn't care less what the "real"
filename is, unlike if it's in .exe format...

I think that there is no solution if total backwards compability is
desired... but I do hope that eventually the TOSEC-compatable renamers
are ported to unix and Mac one of these days, it is kind of a bummer
that only Windows is supported currently...

1112. Booting with APE -- how?

It goes to the memory test screen, so at least much of the computer
is working. Maybe a bad BASIC ROM in there. Others will
know more. How about unplugging the disk drive and see if
it brings up the READY prompt. If that happens then it is
a problem with the drive.

your order is funny. you get the BASIC READY prompt and
then try to boot. Either something is wrong with the APE setup
or you are turning the Atari on before you load a bootable
image into APE, maybe.
For most games you wouldn't get the READY prompt, if you
hold OPTION at power on.

Does the computer go directly to the "memory test" section of the
built-in "self test" menu? Or does it enter the self test's main
menu?

Anders

1119. Where to get atari 800 in the UK (2nd attemp)

Newsgroup: comp.sys.atari.8bit

> russg

Sounds like maybe he's booting the Atari before doing anything with APE, leaving it at a READY prompt. Inserts a disk into APE, tries to go to DOS (which will fail), and hits RESET... probably just warm-resetting it, since the stock OS has no way to let you do a cold reset whenever you want.

I think you got it right in the order being funny... at the very least we need more information. :)

1126. Atari 8-bit Matterhorn cartridge exists!

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-23 09:10:25 UTC
From: elvis69@texas.net
Message-ID: <abfbbc24.0202230110.284cc4fe@posting.google.com>
Source record: 31047
Cross-posted to: comp.sys.atari.8bit,rec.games.video.classic

The long rumored Atari 8-bit Tigervision "Matterhorn" cartridge is currently being auctioned on the ebay site:

ebay item # 1334701064

Many collectors have doubted the existence of this rare cartridge, particularly since it is listed as "Never Released" on the Krieg Rarity Checklist:

http://www.execpc.com/~krieg/links/8bit.carts

The auction listing even includes a cartridge picture and screen shot.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Well if the TV you're using for your Atari is hooked up to a DVD player then technically you are watching DVD's on your Atari's monitor. It's just that easy.

Source record: 31051

Hi, thanks for replying! I'm glad to see this group is still active!!

Anyway, it takes me right to the memory test portion... It skips the usual "SELF TEST" menu... I found that odd too, but I forgot to mention it. Also, when I press "HELP", the button that's supposed to take me back to the "SELF TEST" main menu, it doesn't do anything this time. Could that narrow anything down?

I never actually knew how to read the MEMORY TEST output, but I let it go through and here's what it gives me:

(G indicates a green block, and R indicates a red one)

ROM:
GGGGGGGGGGGGGGG GGGGGGGGGGGGGGG

RAM:
G R R R R R R R R R R G R R R
R R R R G G R R R R R R R R R
R R R R R R R

After the test is completed, it goes back and re-reads the green ones.

Are red blocks bad? I sure as hell hope not! :)

Well, I don't know if this info helps, but again, any input would be appreciated.

Thanks again for your response!

Hulsie

Thanks for the help, Russ! I tried unplugging the disk drive and it
still does the same thing. So I guess we can deduce that it's not a
problem with the disk drive.

Man, I hope this sucker isn't broken. It's like a brother to me :)
Oh well, if it is, I'll just do some E-baying and get a new one.

Hulsie

P.S. --
If I can get the thing working, I just want the newsgroup to know I have
an SIO2PC cable and if anyone wants any software (I have tons, believe
me, TONS of disks, about a thousand... Even stuff that's not on the
popular FTP sites or XL Search...) don't hesitate to ask for a disk
image! I'm working on a list of all my software/cartridges for trading
and disk imaging. Thanks again.

1136. FA (Ebay): Over 30 Atari floppy disk auctions

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-24 06:32:31 UTC
From: bobbyshaw@aol.com
Message-ID: <20020224013231.21381.00000565@mb-ch.aol.com>
Source record: 31057

Hi Everyone! I've just finished listing all my Atari Floppy disk auctions. There were over 30 of them - each listed individually so you can get just the ones you want. There are some applications in there, but mostly games. As sort of "payment" for letting me list my few FA posts I've done since I started, I will give free shipping for these floppies to anyone who mentions this post from the newsgroup. All items start at $1.00 or less, and most have $1.00 shipping (which won't matter if you mention the newsgroup!). Here's the link to my auctions:

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?MfcISAPICommand=ViewListedItems&userid=bobbyshaw@aol.com

And here's a list of most of the software you'll find up for auction:

A Financial Wizard
AdventureWriter
Age of Adventure
Archon
Archon II: Adept
Atari Word Processor
Basic Compiler
Bill Budge Pinball Construction set
Bruce Lee
Choplifter!
Computer Football Strategy
Controller
Deadline
Family Cash Flow 2.0
Fight Night
Filemanager +
Flight Simulator II
Guild of Theives
Infiltrator
L.A. Swat/Panther
Maxwell Manor
My First Alphabet
Program/Text Editor
Seven Cities of Gold
Shootout at the OK Galaxy
Starcross
Starfire/Fire One
Summer Games
Super Huey
Suspended
Tanktics

Temple of Apshai
The Quest
Tomahawk
Zork II

Thanks,
Robert Shaw

I have done that, but I use my Atari clone (the Hades). I convert the ATR to a DI format and then run the DI file through a program called 800xldj on my Hades. From there I can copy the files to a 1050 drive that is connected to my 130XE. I am sure that same type of thing can be done with APE.

You seen them there?

What area are you, I'm moving there :-)

Never seen them at the B.S in East London which has some of the
biggest sales I know of :-(

>I have a PC 5.25" drive<

1. If you have no Atari equipment, you will be limited to creating MFM Atari disks. I don't believe that any programs can currently do this, but it should be possible to create a DD image from a SD ATR image then write out the DD. This would work for Dos disks; might be possible for game disks.

2. If you have an Atari drive and a ProSys cable, you can write out ATR's directly to the Atari drive.

3. If you have an Atari computer and drive and SIO2PC/APE cable, you can write out ATR's.

4. There are many other ways...

Yes, the relatively high number of participants in comp.sys.atari.8bit

confirms that the Atari 400/800/XL/XE computer series has had a
long-term positive impact on people like you and me.

I am sorry, but I think your computer has RAM memory faults. I must
admit I have never seen the self test recognize memory faults on an
Atari computer myself, but the result is probably correct.

At least, now you know where the fault source is likely to be
located, thanks to your Atari's error detection.

Maybe the 130XE has all chips soldered to the board. But if you open
the computer and find memory chips in sockets, you could remove
them and put them back, to find out if bad contact is the reason
for the fault.

It is fairly easy to find a used Atari 130XE, but my opinion is that
one should repair broken Ataris. They deserve it.

Sure, I think I just forgot to send you an ACK. BTW: Thanx!

I hope I'm able to upload a new version in a few weeks. Currently I'm only fixing some bugs. The new version will (hopefully) support all double density formats I know of (180k/360k/720k/1.44M) with several sector mapping types (XF551, track first (like ATR8000), head first (like PC drives)).

The often requested GUI (like AtariDsk) has to wait a bit, since I've got a lot to do at my job at the moment.

Anyway, I'll let you know it when it's ready.

so long,

Hias

Red blocks are bad - sorry. First thing I'd do is check your power
supply voltage, it should be 4.8-5.0 volts and steady as a rock. If
not, get a new one of those before you go replacing ram chips or you
will burn them out too.
That's the number one reason ram chips fail - a bad power supply!

Ahh... thank you for your support! I agree that it's not perfect, but
there is no perfect way with disk images, and I feel this is the best
current solution, and since I have a great love of the Atari 8bit
computers and the existing TOSEC dbases were pretty iffy, I
volunteered to help.

Yesterday I finished my second big step of the renaming process, and
now everything from the three old existing TOSEC .atr dbases is
recognized, along with some new stuff (including side A of The Haunted
Palace)... a grand total of 2,819 recognized .atrs, all games, NO
demos, multiboots, apps, etc. Basic and OSb info should be (hopefully)
be correct in every case, as should most of the other notes. This
dbase will be released by TOSEC in their next update, which will
probably be in the next week or so (it sounds like, I have no official
info for sure.)

Help would be letting me know (via e-mail or TOSEC's forum) if you
find any errors or if you can fill in any missing information or
supply more info that'd help. Also let me know of any game .atrs that
you have that are unrecognized.

Next step is to go through and mark all the file conversions (K-boot
disks) as such, and to start convering the raw .exes that haven't been
converted yet. This should help clarify some of the "alternates" that
are in there now.

I'm not sure, but I would suspect that a flood of the files will
appear in a.b.e.misc (and probably one or two other groups) after

TOSEC releases the dbase... ;)

I doubt you have that many bad memory chips, something else
is wrong. At any rate, you need to open up the computer.
A funny test for memory chips is to turn the computer on
for a minute and see if the memory chip(s) is hot, if it is
it is probably a bad chip.
I think the memory chips are the little ones on the left in the 130xe.
I'm thinking some memory access chip is flaky.
The 130xe is generally without sockets, so my standard approach
of swapping out known good chips with the ones in the computer
won't work.
Another approach is get a working 130xe and a logic probe.
Start with the large chips, the Antic, CPU, Pokey, GTIA, and
the ROMS and compare logic probe signals at each comparing
pin.
Now a person like Rick Cortese would know how to use an
oscilloscope to check pins. I have an oscilloscope, but don't
know how to use it. It is an old Heathkit o'scope with tubes in it.
Uh. I think your computer is sorta messed up, but, thinking some
more, the Antic, GTIA and display aspects of the computer and
the CPU are good or you wouldn't get the mem test screen, it
also means the OS ROM is good. All those bad mem chips
just doesn't seem likely tho, maybe one or two would go bad,
but I don't think all those at once.

I don't say I don't agree, but I only saw the postive things listed about ATR
and long filenames, but noone mentioned the disadvantages effects...

About help... well, I wish I had the time to do some more on Atari 8-Bit.
Still have a number of unfinished intro-sources laying around, like also a few
thousand disks of which I have no idea what's on it. All are numbered, and
maybe on one of them is a database or something like that with info about
what's on a disk, but haven't found it yet :-)

Hi,

I used to own an Atari 400, then the 800, and then the 520ST. I traded my old systems for a Gemulator card which I have installed in my P2 - 450MHZ IBM compatible computer. I have also down loaded the free version of Gemulator 2000 from emulators.com. I was able to transfer much of the data that I had created on the 520ST to my PC. I am interested in recovering any data that was saved to the 5.25 floppies from the Atari 800, but no longer have the hardware. I know about XFORMER, but I guess I also need an XFORMER cable, and a 1050 drive, and the software. Is this the way to go? Is my system too fast to use the cable? Is there a better way than using XFORMER?

Any suggestions?

Craig

I was just gonna suggest that. I'm a bit too far (toronto, ontario) to pick them up but having the
pd library online would be good. but atr format is a bad idea. I and many others use real 8bits
not emulators and the atr images won't be of any real use to us.

Atari Basic does not have a DIR command built in. If I remember correctly
you can do
DIM X$(20):OPEN #1,6,0,"D:*.*":FOR I=1 TO 64:INPUT#1,X$:PRINT X$:NEXT I
Or use the DOS command, but if you have a Basic program in memory and
Mem.Sav is not
enabled you will lose the Basic program.
```

Get yourself a 5.25 floppy drive for PC from ebay and try WriteAtr from this guy's website

http://www.horus.com/~hias/atari/

Hias

I'm waiting for my 5.25 DSDD disks to come in to see if it works. It worked for the author.

Same is true for the 810 and the Percom series of third part A8 equipment.
They will normally error during 2nd stage of the format process. They may
eventually format with repeated attempts and then fail to read and/or
write...

The XFormer cable is limited to CPU speeds of approx 150 MHz or less.

APE and SIO2PC are good options when you still have the Atari and drive.

Otherwise, for a one-time convert - just find someone with the required
hardware to make the transfer.

Hias does good work and I swear by his AtariLink, *but* it only works when your A8 drive is a Doubled or Happy 1050 or other true double density equipment like Indus and some Percoms. It is not applicable to 810s and stock 1050s.

Haven't had to buy any in YEARS, but a quick search on Yahoo Shopping found a couple stores still selling boxes of DS-DD 5.25 floppies. Here's the search I did:

http://search.shopping.yahoo.com/search/all?is=1&p=ds%2Fdd+floppy&tool=0&did=

The two stores I checked (the more well known being CDW) had them in stock and around $6-$8.

I guess the 10502PC cable or APE Prosystem cable.
The Prosystem cable is the only cable and software that would
allow making images of original copy protected disks.
But since you say 'Data' I'm guessing you have some text
or database or something you want to save.
I don't use any of these. I think the mentioned cables allow
connection of a 1050 to serial port of PC. If you have single
density Atari 8-bit disks, you won't be able to read those disks
on a PC 5.25" drive.

Unless you want to write a quick directory BASIC program,
just type DOS from BASIC. Then depends what DOS you're using.
SpartaDOS, type DIR. MyDOS, hit the # of the drive. DOS 2/2.5
type A and hit RETURN twice or give a filespec for a different drive.

Specifically, I have some single side double density floppies with text files created using Atari Writer and DOS 2.5. The drives being used were an 810 and a 1050. I don't remember what configuration the 1050 was.

I do have a PC 5.25 drive in my PC computer.

Try WriteAtr V0.91 beta (c) 2002 by HiassofT

This program allows you to transfer double density (180k) ATR-images

directly from/to Atari-XL floppy disks with your PC!

All you need is a PC running MSDOS and a 5.25" floppy drive in your PC!

e-mail: hias@horus.com

WWW: http://www.horus.com/~hias/atari/

See also manual.

Fanny.

->INPUT#1,X$:PRINT X$:NEXT I Or use the DOS command, but if you have
->a Basic program in memory and Mem.Sav is not enabled you will lose
->the Basic program.

Reference here to Mem.Sav appears to assume use of the Atari
Company's DOS program. Other DOS programs, such as OSS DOS-XL, don't
need Mem.Sav in this situation. In DOS-XL, one can go to DOS and use
the DIR command without losing the Basic program in memory.

1182. Anyway to make ATR files from Atari disk using my PC (no SIO2PC)?

Newsgroup: comp.sys.atari.8bit
Date: 2002-02-25 18:01:10 UTC

Ron H. mentions that stock 1050 and 810 don't do 180k dbl
density. I'll mention you said DOS 2.5, which also doesn't do
dbl. density. Not familiar with the Hiasoft atr read/writer, but
it does require MFM dbl density disks.
Dbl density floppies (with the hub ring) can be formatted the
Atari FM single density. I don't know if there were single
density floppies and if they had hub rings. I do know that
High Density (1.2 megs) usually don't have the hub ring.

If you have the Atari disks in 256 byte/sector format there are several
utilities that will read them.

The stock drives using 128 bytes/sector like the 810 and 1050 are
problematic. You may or may not be able to read them on a PC with ANADISK.
If ANADISK does read them, then you have to use Preston Crow's DEANA to
convert them into a format an emulator can use.

> not emulators and the atr images won't be of any real use to us.

ATR images are, IMHO, much more useful under any circumstance than real disks... especially since many old floppies have bad sectors already and are only going to get worse... The $5-10 that you'd spend on a box or two of blank 5.25" floppies will pay for an SIO2PC cable, which will allow you to use .atr images on your real Atari, and those atrs can easily be distributed, backed up, modified, used like real floppies, whatever, with none of the fear of the disk going bad, or trying to make backups from one 5.25" to another... Throwing $40-50 Steven Tucker's way (to register APE) is a nice idea too, I would have done it already but my damn PayPal account got "restricted" somehow and I haven't gotten around to proving to them it shouldn't be... as soon as I do, I'll register, I promise, Steven! :) (though I'm still not convinced that it will work properly with my UltraSpeed+ OS, someone said it did for them but it looks like the "read" ability should be exactly the same with the unregistered vs registered... whoops, off on a tangent here!)

Regardless, I never got a response from the fellow offering the stuff up (I sent him two e-mails as well as the note here) so it's a moot issue at this point... if he does respond at some point in the future, I'm ready and willing to take the stuff off his hands and do my best to preserve whatever can be preserved from the software collection.

In that same ftp site, I was surprised to find some games for the Atari ST.
I downloaded one sample (ie. Hacker2.zip). But after I unzipped it, all I
got was a filename.msd plus a folder.

What is an MSD? is it a compression format or diskimage for ST computer?
Normally it should say ".prg" as the common extension for ST executable
code.

For your answer, I remember someone posted up here about the 8-bit emulator
for the Atari ST: the Pacifist, I think. I haven't try it out yet, but I
have tried out the Rainbow emulator (8-bit for the PowerMac). Amazing -
supports smooth-scrolling capability, just like the Atari!

anyway....

Question: Is there a SIO2PC-version for the Mac? To be exact, a
SIO-to-Serial for the Mac?

I am still deciding whether to buy a used SIO2PC or order one for the Mac.

Are all SIO2PC cables created equally? (pins-by-pins circuit-wisely). I
hope any SIO2PC cables will work with APE software.

If you have an 850, P:R: or similar interface you can transfer data between
the two systems with a nullmodem cable. If the disk is a bootdisk, you first
have to make a DCM image of the disk with DiskCommunicator. The DCM file can
started up with Atari800Win, or you can use DSK2ATR or Imagic to convert the
DCM to an ATR onto the PC system.

Hi,

> With a 1050 drive?

No, the magnetic media used in HD discs has very different properties to that used in DD discs.

If you can even get them to format, which is difficult (though not entirely impossible), you'll find that the data will quickly become unreadable (in some cases within MINUTES).

>need the pinout for the minidin video output of the VCS
>7800 (French version, if it makes any difference).

Any chance of your posting a picture of this machine somewhere for us to see?

To the best of my knowledge no standard 7800 ever had any form of output other than UHF/VHF via a modulator, though there is a modification you can perform to add a composite output yourself which I've seen in various places around the 'net.

Maybe your machine has this mod fitted? If so you need to open it up and work out the connections for yourself.

As I understand it (just having learned about this myself in the past
couple months), this is the way to refer to a raw executable that has
been converted (via the MakeATR utility) into a full disk .atr image -
the name given because, when booting, there's a "k" displayed in the
corner of the screen.

(Digging back into my ST memories...)

An MSD is a "Magic Shadow" compressed disk, if I recall correctly.
Sort of like the ST version of "DiskComm", in that it was actively
used by the users of the real PC, not just emulation folks. I don't
follow the ST scene as closely as the 8bit, but I would assume that
either emulators can use .msds natively, or there's a conversion
program (to the usual .st file), or (probably) both.

BTW, are you from Rochester, NY? Your name seems awfully familiar.

1199. TOSEC Atari 8bit Games database released

Newsgroup: comp.sys.atari.8bit

Thanks for all your help guys! It is very much appreciated! I totally agree with Anders' statement about repairing the Atari versus getting another one. I'll do everything in my power to rescue the one I have now :)

At any rate, I think a faulty power supply is indeed the problem. I don't really know that much about electronics but I conducted this little test and here's what happened:

First I plugged the power supply for my C-64 [Yes, I admit it-- I'm also a Commodore owner... Sorry!]into the Atari (it has the same number of pins so it fit perfectly). The power light on the Atari came on, but the screen output was weird and messed up. This didn't surprise me, I figured it would do something like this since the systems are incompatible. I just wanted to see if the Atari would at least, uh, read (?) the other power supply. Then I plugged my (faulty?) Atari power supply into the Commodore and turned it on, and the C-64's power light wouldn't even go on, and there was virtually no output on the TV. Shouldn't it have at least lit up the power light, like the Commodore's power supply did on the Atari?

Again, I don't know squat about this kinda stuff so maybe this test proved nothing at all. What do you guys think?

If it is the power supply, is there anyway of fixing that, or would I just have to get a new one? If I do have to get a new one, would it have to be an actual ATARI power supply, or could I just rig up some makeshift one to act as it?

Thanx again,
Hulsie

>:)
>

If you DO decide you want another one, I'm putting mine up on Ebay in about 2 weeks, after I finish up my current floppy disk auctions. It;s been carefully stored in a closet since the late 80's and I've been using in quite a bit in the last month testing all my cartridges and floppies before sale. I've had no trouble out of it or the power supply since I've hooked it up. Let me know if you're interested, and I'll e-mail you when I list it.

I think you shouldn't go plugging power supplies into devices they
were never meant to power without knowing that they are compatible ...
a sure recipe for disaster.

If you want to test a power supply, get a voltmeter from your
local electronics shop or something. Don't go plugging it into other
devices to see what happens.

Hi,

xxx) Could there be a program which runs on NTSC Atari and not on PAL Atari?

Yes, if it uses some precise timing copy protection (probably based on vblank timing). Examples of these are Transylvania and The Quest by Penguin Software.

Hello Edward,
what program do you use to convert ATR images to DI images ?!?
Will that program work on other ataris, like ST, STE, TT or Falcon ?!? A
friend of mine has a TT (I think) and uses the XLDeejay, maybe with your
converter program he would be able to convert some ATRs into DI
format... By the way, does this converter also work in the other way -
converting DI images into ATR images ??? -Andreas.

Hulsie, Hulsie, Hulsie.
As somebody said, don't go plugging pwr spplies in.
Check the brick, it will say what the power specifications are.
I don't know the C= one. The 130xe one is 5 volt, about 1-1.5 amp.
If the C= is the same, then it is still maybe not alright as the pins
may be different (I mean the +5v may be on the wrong pin).
To test your Atari ps, you should find the +5 pin (probably in
the comp.sys.atari.8bit FAQ) and a ground. I started to say
you should put a load on the ps, say a 5 or 10 ohm resistor,
then check to see that there is still 5 volts. Putting a resistor on it
would be difficult to get a clip lead to attach to a pin without shorting
anything. A better way would be to open the computer and find
attach a clip lead inside the computer to a +5 location, then
turn the computer on and see if it has 5 volts. I don't know much,
but a wrong or bad ps can cause serious trouble.

I'm with Gav on this one! Same # of pins is nowhere near compatible; you could fry both systems and both power bricks if the voltages, etc. are widely different.

BTW, if you have a spare PC power supply, you can connect its 5V tap to the cable from the dead XE power pack. The pin outs are on Thunderdome: http://www7.ewebcity.com/atari/

Howdy *.*!

While reading a book I found a comment about "DOS V1.0". I never found
this version, but it would be nice to have a version as an ATR Image.

Can somebody help?

Are there some more detailed informations about the various DOS
versions, as well why DOS 3 never succied?

I think you might have fried your commodore too!! Go to Radio Shack
and drop $20 dollars on a Volt-Ohm meter and verify that you have 5
volts comming from your power supply - that's the only way to know!
Russ is right about the hot chips being the bad ones, but on that
130XE, the board doesn't like it when you desolder chips. The traces
will lift up very easy, considering your level of electronics
knowledge, you are better off selling it as non-working and getting a
good one somewhere - seriously. Just ask, you won't get one valid
reccomendation for desoldering a 130XE board, its best left to
wizzards and such.

Atari power supplies tend to be throw aways due to the gob of epoxy
that the guts are 'potted' with. You can't get to the parts even if
you bust open the case. So again, buy a replacement. Or two. Best
buys are the 1.5 amp supplies as they tend to not burn out so often,
I'll bet yours says 1 amp don't it?
Http://www.jameco.com has some power supplies that you could splice
your Atari ends to, if you wanted to go that way. Just be sure that
its 5 volt, regulated, DC and at least 1 amp - up to say 3 amps. Best
of luck

http://www7.brinkster.com/atari/ataridl/dosdisk.htm#top

It's a DCM image, packed with LHARC for max. compatibility on Atari 8-Bit.
(you can "de-crunch" and "de-image" it on Atari 8-Bit)

Use a "DCM-to-ATR" (or "DSK-to-ATR") converter for PC usage.

: Are there some more detailed informations about the various DOS
: versions, as well why DOS 3 never succied?

That's an easy one. Incompatibility. The only DOS version that is compatible
with 3.0 is 3.0 itself...

Hi,

> First I plugged the power supply for my C-64 [Yes, I admit
>it-- I'm also a Commodore owner... Sorry!]into the Atari
>(it has the same number of pins so it fit perfectly)....

JEEZ!!!!!! That is an *EXTRAORDINARILY* dangerous thing (for your hardware) to do!!

The C-64 PSU may have the correct number of pins on the connector, but it certainly isn't wired up the same way! In fact many/most C-64 PSUs output 9VAC in addition to the usual +5V DC....so the chances that you have now fried every chip in your Atari are truly excellent.... :-(

>....The power light on the Atari came on, but the screen
>output was weird and messed up....

You don't say...!

>....I just wanted to see if the Atari would at least, uh, read (?)
>the other power supply....

You must NEVER, ****EVER**** do this, unless you are ****ONE HUNDRED PERCENT**** certain that the PSU connectors are wired the same way and provide the EXACT same voltages on the same pins!

I cannot stress this point strongly enough.

>....plugged my (faulty?) Atari power supply into the Commodore
>and turned it on....
>....Shouldn't it have at least lit up the power light, like the
>Commodore's power supply did on the Atari?

No, but the chances are that you haven't actually fried the C-64 by doing this as the Atari PSU doesn't output any dangerous (to the CBM) voltages.

There are only two reasonable ways to test whether a PSU is faulty: 1) Use a multimeter to check the voltages on the appropriate pins (the best way), or 2) Get an IDENTICAL, known to be working, PSU and substitute it for the suspected faulty unit.

> Again, I don't know squat about this kinda stuff so maybe this
>test proved nothing at all. What do you guys think?

The ONLY thing you've done is to probably fry your Atari I'm sorry to say....

>....If I do have to get a new one, would it have to be an actual
>ATARI power supply, or could I just rig up some makeshift one to
>act as it?

Unless you're well versed in electronics (or know someone who is and can fix/make you a PSU) GET AN ATARI ONE!

TTFN - Pete.

Or you can use this one-liner:

O.#1,7,0,"D:*.*":F.I=0 TO 256:GET#1,I:PUT#16,I:N.I

this should get you the whole directory and end with an "ERROR- 136" message,
after which you can type either "CL.#1" or "END"

using PC to write atari floppies with a pc 5.25" drive the disks will not
work on a regular 1050 or the 850.

look at this page ...

http://www.atarimax.com/

It will allow you to connect an atari computer to your pc serial port with a
special cable and basically use all your atr disk images as if they were
real disks seen by your atari computer. Up to eight disk drives can be
emulated and also hard disks.

Check out www.vgmix.com for some remixes of video game music. Found among the later tunes, a remixed BallBlazer track. Search through the site or use the link below to download. Here's the info that went with the link:

BallBlazer, LucasArts, LucasArts
Arranged by Freon - 04:40 | 128 kbps | 4.28 mb
The original theme from the Atari 400/800XL game BallBlazer, sampled and remixed. Enjoy, or not. freon@skyenet.net

http://www.vgmix.com/download.php?sid=103

Groovy...now I can't get it out of my head...

Howdy *.*!

I've planned to built a little intro or demo program on my atari. I wrote my last assembler program years ago, so I lost my techniques *g*.

So my question is: can you recommend *latest* programmer tools, just like assemblers, font editors, graphic conversion, sound editor and libraries?

It's because, I don't want re-invent the wheel and try to speed up the developement.

also, do you have some ready made tutorials for dli, vbi and sound programming?

For assemblers, the fastest ones are cross assemblers for the IBM/PC
platform. MAE is at the univ of mich archive and is a native assembler for
the 8 bit.

There are a couple of other editors like TEDIT and the disk version of
MAC/65 is either PD or shareware now.

Libraries and font editors, good luck. I don't think any of these have been
updated in the last 15 years.

Is it possible to combine TEDIT with MAC/65? Or combine it with any
other editor? I have some problems with MAC/65, during it's
complicated number-format editing.

>Libraries and font editors, good luck. I don't think any of these have been

I too think Lee's explanation is correct. You should try to repair
the power supply, before you do anything else. Any TV, radio et
cetera repairs company should be able to help you.

>... First I plugged the power supply for my C-64 [Yes, I admit it--
> I'm also a Commodore owner... Sorry!] ...

The Commodore 64 is the best home computer counting from 1982-1983,
while the Atari 400/800 is the unrivaled king among home computer
architectures created and releaased 1978-1980.

> ... into the Atari (it has the same number of pins so it fit
> perfectly). ...

This could be seen as capital punishment for a home computer. Maybe
the Commodore 64 deserves it, but certainly not your Atari. ;)

Your story reminds me of a mistake I made with my home PC about a
year ago. One night, I connected what I thought was my USB hub's
power supply to the hub and began using the computer.

After a while I noticed yellow light coming from the hub. Since I
had not noticed any internal LEDs in the hub before, I found it a
bit strange but did not examine the equipment.

It was not LEDs. The bright glow came from burning components. They
exploded one after another within a few seconds after that.

I had connected the power supply that came with my "force feedback
racing wheel" to the hub.

> 2049/Defender/Starraiders be used with them ?

The XEGS is compatible with the XE computer series. Most old
cartridges should work, although there are some exceptions. These
exceptions have to do with incompatibility between some 400/800
software and the entire XL/XE/XEGS range. In other words, the
incompatibility is minor and not XEGS specific.

In my opinion, many of the games that were released by Atari when
the XEGS was launched are not cool at all - "Barnyard Blaster" et
cetera. I prefer older games like Miner 2049er, Defender, H.E.R.O.,
and other classic games that really are top quality compared with
Atari's dedicated XEGS releases.

While we are at it: Not only Atari, but also Commodore and the
Amstrad (UK) company tried to challenge Nintendo's video games
domination. Atari probably saved otherwise wasted money by not
spending much effort on its attack on the video games market
with the XEGS. But it would certainly have been cool with at least
a few new, well made games for the XEGS release.

I too have used this. I remember I wrote this type of tiny BASIC
sequence to a file called "D", containing text only, and then typed

RUN"D:D

to display directory contents. I am not sure if it can be done without

a BASIC row number, but even with a row number, this implementation of

the equivalence of a "DIR" command has very low impact on your
BASIC session.

On the cartridge version of MAC/65 I know you can. It has the same format as
Atari BASIC where you can either ENTER or LOAD text or tokenized MAC/65
source code depending on the editor you use.

I almost got into TEDIT myself, but I never figured out how to change the
left margin from 2 to 0.
>
> >Libraries and font editors, good luck. I don't think any of these have

> Do you remember their names? What tools could be used for what?

Several times people uploaded pretty extensive MAC/65 macros to various
sites. Much more extensive then came with the MAC/65 Toolkit. I don't know
if any are still in existance. I got a bunch from the old Compuserve. You
may want to try the umich archive.

There also was a series of articles in ANALOG on making BASIC like commands
using MAC/65. I can't remember the months in question, but the macros were a
pretty nice set.

: > DIM X$(20):OPEN #1,6,0,"D:*.*":FOR I=1 TO 64:INPUT#1,X$:PRINT X$:NEXT I

: I too have used this. I remember I wrote this type of tiny BASIC
: sequence to a file called "D", containing text only, and then typed

: RUN"D:D

Try:

```
32765 OPEN #1,6,0,"D:*.*"
32766 TRAP 32767:GET #1,D:? CHR$(D);:GOTO 32766
32767 CLOSE #1:TRAP 40000
```

Put it on disk as
LIST "D:DIR"

When in BASIC, type

```
ENTER "D:DIR"
GOTO 32765
```

and the directory will be listed to the screen without loosing your BASIC prog in memory. Also the opened IO channel will be closed (by using the TRAP command). Just remember to erase those last 3 lines when saving the final version of your coding...

1st: you corrupted your 'I' loop variable... it changes with each 'GET' in
the range of 32 to 90 which in this case will probably perpetuate the
listing until EOF #136.

2nd: '0 TO 256' only gets the 1st 15 or 16 directory entries; I use '999'
for ease of typing and even it may be too small for full 64 file
directories.

3rd: And why a '7' in aux1 rather than 6?

There were several early on probably beginning with Mosaic and Axlon up to 160K (48K - 16K + 128K). I also heard about 288K up to 1088K mods over the years, but never had the instructions and diagrams.

The Atari Macro Assembler does not use line numbers AND allows multiple
statements per line similar to A8 Basic. I never got into Medit and
preferred TextPro or similar for doing the source, however.

I know Atari AsmEd cart has auto-numbering mode and probably Mac65 too.

Hi,

> Well Im currently looking at getting a machine (weighing
>up options)....

Good luck, whatever machine you get you're in for a lot of fun!

>....So it will be a 850 (if thats the old one) or a 1050....

That's an "810" or 1050. The 850 is the printer/RS232 interface module.

If you have the choice you're probably better off getting a 1050. They're a little newer and have the advantage of being upgradeable to true double density operation.

>....I was wondering if the disks can be written using a 5 1/2
>drive on the PC ?

I'm told you can, but you need a 1050 upgraded to true DD to read them on.

Much less hassle to connect the 810/1050 to your PC and write the disc images directly using one of the cables/programs designed for this sort of thing.

TTFN - Pete.

The corrupting of I may be intentional, it will keep I from ever reaching 256, so it will
read all entries until the error #136. I also thought the second parameter to
the open is usually 6 for directory although I think 7 meant something
special for DOS 2.5, like showing the angle brackets for files not available
to DOS 2.x.

Don't think there is one (anymore), that is, the original assembly
sourcelisting. It once was published as a data type-in program in "Happy
Computer". One had to type numbers which represented the actual binary file
(as you would read it back from disk with a sector-editor).

I bought an interesting 512K (800) plug-in ram board a couple of years ago that has one jumper that has to be connected. It uses 1 static ram chip and has a 3V battery, so the ramdisk is battery-backed. It came with a modified MyDos. Since I use a 130 XE most of the time due to space considerations, I haven't used it very much. I've always liked the 800, but they are BIG compared to XL's and XE's.

I've been looking for that also with no success for sometime now.
I tracked down the author, at least he initially replied back that he was
the author of GFA-Basic. Frank authored both basics. But as soon as I
asked for source/help with GFA no replies came back. ;-(

Does the ram board still work in your atari 800?

Would something like Basic XE be able to use that extra memory and run fine
on the 800?

I read some of this thread.
You might want to look into Mark Schmelzenbach (sp?) cross
assembler. It is really very neat and you can use any PC text
editor to creat your asm files. This site also has 'Envision' a
graphics/char set editor (not into this stuff much myself.)
http://www.cs.utah.edu/~schmelze/atari/index.html
I never had any luck with even the most easy testing/trying to
get to work on MAE. It always crashes on me. I'm sure
it is because I don't know how to use it and didn't read
the doc.

did you generate some usefull code with it? I did assembled the
"test.m65" ... the ouput file "test.65o" just crash's my atari.

Did you successfull generate the object file into a xfd image?

Has anyone used AnaDisk 2.0.6 to read from an Atari Floppy using a PC 5.25
drive.
On this web site is described a proceedure to read from Atari Floppies.
http://ch.twi.tudelft.nl/~sidney/atari/

Can I use the described procedure to read my old Atari Floppies without
first formatting them. I was told in a reply to past questions that:

"If you used DOS 2.0 or 2.5 the disks will certainly be formatted with128
bytes per sector (FM for single density/90k, MFM for enhanced
density/128k)."

Would it be possible to notch them and use the procedure if the flip side is
not formatted?

Craig

well I have to reply to myself!! I did have success with compiling
some samples with my favourite Editor under WinXP und testing in
Atari800Win Plus.

So my configuration is now:

EditPlus+ 2.10c
ATasm 0.95
Atari800Win PLus 3.0

I configurated the EditPlus and the emualator with some key shortcuts
and get a DOS2.5 executables in "0s consumed" and to run in 1s :-)

Well NOW we can programm ...

(Thomas tries ATASM)
Right, the sample 'test.m65' crashes if you try to run it.
It is just a sample demo of all the opcodes and macros or something.
No, I didn't make a .xfd of the test.m6o. I forget what I used
it for. I do remember that Tom Hunt uses it for development,
he told me about it, so it must be good.
I think I was using another program to disassemble something, then
used ATASM to re-assemble it. It was Eric Bacher's 'DIS6502'.
Another PC tool, this one for disassembly. I got it from
Steve Tucker's site, but I think the author has a site.
http://www.atarimax.com/dis6502/
I was trying to dis-assemble Sargon III, a load file I made out
of the boot disk. I've always wanted to understand chess algorithms.
I don't think I'll ever understand the dis-assembly, as there's too
much graphics and other stuff in it (the load file I made.)
I still prefer Sargon III, it isn't stupid like MS chess game and
not so smart I can't beat it like ChessMaster.

yepp. For that fact I needed 3hours of testing :-)

>it for. I do remember that Tom Hunt uses it for development,
>he told me about it, so it must be good.

well I think it's exciting!! I never developed asm progs in that fast
way. It's like a revolution in creating new programs for 8-bit atari.

>http://www.atarimax.com/dis6502/

the disassembler exciting as well. But I think your problem is my
problem, coz I can't program assembler too much... and disassembling
is much harder - I think.

>not so smart I can't beat it like ChessMaster.

.. algorithm in asm .. *grin*

If I got into assembler, like Thomas seems to be doing,
it would be necessary to have libraries of macros. With these
macros, it becomes almost like BASIC. You pass a few parameters
and the macro does the rest, returning after doing what you
wanted. It saves much coding time. I believe Rick Cortese
mentions a collection of macros from ANALOG. I have never
used a macro in assembler, don't really know how to use them.
ATASM is a macro assembler, and is like the MAC65, but
ATASM seems much more flexible, requires no line numbers.

>Hi ron, I have it. To gether with the tech-manual (hardware discription).
You can buy them from best-electronics. <

You have "Secrets of Atari IO" from IJG (publishers) written by Eric VerHeiden
-- for $4? I don't believe you can buy this from Best Electronics -- it's not
in their catalog and not listed at their web site. Yes, the Atari Hardware &
OS manuals are readily available, but the question is about an unpublished book
that had only a few manuscripts copies produced.

You seem to be wanting to use the flip side of your A8 floppies
for use on a PC, and I think, leave the original side untouched.
You can't use the flip side on a PC, it has to have the timing hole
in the correct place. It would seem risky to try to use the flip
side of a A8 floppy that has stuff on it you want.
Right Anadisk can't read FM 90k single density A8 disks.

On this web site:
http://ch.twi.tudelft.nl/~sidney/atari/
He describes how he "got it to work"
Of course I don't want to Format my floppies because I would loose the data
I want to recover, unless there is a safe way of Formatting them. The
reason I think that my floppies may need to be Formatted for this to work is
because he mentions it. I don't know if my floppies meet all the
preliminary requirements for his proceedure to work in my case.

****
Utilities to transfer disks from the Atari to your PC
In the newsgroup comp.sys.atari.8bit questions are frequently asked about
transferring files from the Atari to the PC or vice versa. The low-cost
solution of reading Atari Single Density floppy disks with a PC 5 1/4" disk
drive is often mentioned, also in the FAQ - yet I have personally
experienced some difficulties in getting this done. Here's a step-by-step
guide to how I (finally) got it to work:

Format a 5 1/4" floppy on the Atari, on both sides. This means you'll have
to cut a piece out of the floppy at the place where the write-protected tab
would be placed, otherwise the diskdrive will think the back-side is
write-protected.
Use Anadisk 2.0.6 (instead of the newer Anadisk 2.0.7 which appears to be
buggy) to read the floppy from the PC, using the DUMP option. Specify first
track 0, last track 39, first side only, include sector information as
options.
Exit Anadisk, then use DEANA.COM to convert the dumped image to a standard
ATR format disk image.
Use ImageMan or another utility like that to grab the files you need from
the image.
If they are text files, you will have to use an editor or other utility to
replace the ATASCII code $9B (155, decimal) character to newlines. In
MS-DOS, you can use the utility TT.EXE which translates Atari 8-bit files to
PC files and vice versa.

This could be true, but the Magic Shadow program uses a file with the
extension MSA. MSD could be another option. The ST extension file is
used by emulators like Pacifist for the PC. I usually run a PC program
that converts the ST file to a MSA file and then I use Magic Shadow or
a similar program to convert it to the original ST disks.

>Cheers

That is possible. There is a program for the PC that runs under Windows
that will extract all the files from a Mega ATR image file. I did that
and made some Mega DI image files that could be use by either my STe or
my Atari Hades clone. But I could hook up my 130XE to my Hades and
install any of the files on a 5.25in disk using the SIO2ST(PC) cable
and the ST program 800XLDJ. I would rather put all the programs on a CD
and use my STe/Hades as a disk drive and run the program through my
130XE.

The first batch of Electronic Arts games were amazing though - Archon, M.U.L.E. and Pinball Construction Set (let's forget 'Hard Hat Mac') were simply state of the art for the time.

IIRC the image of the company was that of a rebellious group of top coders out to do their own 'artistic' thing, free of the restraints imposed by the big companies of the time.....

..... Hard to believe, therefore, that this is where the current coporate behemoth of EA started out from.

The problem isn't with ANADISK or the Atari floppies. What happened is the first IBM PC floppy controllers were built with FM capability while quite a few of the clone cards apparently weren't to save a penny or two. There never was a FM format built into the orignal MS DOS OS or PC BIOS, so some after market floppy cards did include the FM mode. You can never be sure if you have a compatible controller w/o testing.

I found at least one integrated motherboard chipset that handled FM mode. I believe it was an early VIA chipset. I haven't tested anything in the last 5 years so I don't know if the current crop of integrated chipsets are compatible.

I read that about how to get info off of Atari disks with Anadisk
and Deanna.
It does mention single density.
I'm afraid I can't follow the logic there. I see no reason given
for formatting both sides of the disk, as only one side can be
read using Anadisk. Perhaps he's saying by formatting the other
side, it helps Analdisk to work.
If he actually did read sngl. dens. disks, it is a puzzle to me because
the PC controller doesn't do FM, there may be rare or very old
controllers that can.
The use of the PC 5.25" is not the best way to transfer files Atari
to PC. I did it for years, using double density disks however.
You have to have a double density Atari drive, a US dbler 1050,
Rana, Indus or xf551, maybe Trak Percom, Archiver, Happy, etc.
Since I made my APE/SIO2PC cable, I no longer try reading
and writing Atari disks on my PC.
Another way to transfer files Atari<>PC is with a null modem
cable and BobTerm and a PC term program that uses Zmodem.

Well,
and the only DOS that is compatible to DOS 4 is DOS 4.
The only DOS compatible to DOS XE is DOS XE (in my version even the DOS2
to DOS XE converter did not work...). Better do not use DOS 3, DOs 4 or
DOS XE to avoid compatibility problems. The rest is your choice: a) DOS
1 er DOS 2 + clones/compatibles, b) Sparta DOS + compatibles, c)
MultiDOS/Alphaload and similar versions and finally d) Gamedos
versions... -Andreas.

Well,
"visit" the polish demo-scene and you will soon find the newest assemblers, font editors, gfx programs, conversion programs for almost any purpose and much much more. To start at atari-area would be a good choice or visit the taquart homepage or visit Heavens homepage to read some good info about writing/coding a demo ("why such bullshit?" and "how its done?"). Most if not all links can be found at the abbuc homepage www.abbuc.de or at marek tomczyks atari 8bit resort www.uni-karlsruhe.de\~marek.tomczyk\8bit.html good luck -
Andreas.

Hehehe,
got you ! Can you give me some infos about the Axlon, concerning its
banks and control bits or any other useful info ?!? As you may have seen
I have started compiling a list of Atari ramdisks. Read this list here
in the newsgroup or in the A8FAQ by Michael Current. An update of this
list will be avaiable soon, since I now have some more info about the
K.Peters Megaram 3 (256k and 1024k) RD, the Newell Ramdisks (1024k), the
TOMS Ramdisks (256k, 512k, 1024k) and a few other stuff. But info about
Atari 800 Ramdisks is still missing as well as some infos about PDI
ramdisks or cartridge ramdisks... Please be so kind and tell me more
about your Axlon RD. greetings, Andreas.

True on all counts... somewhere I still have (hopefully!) a mini-poster that was in Electronic Games or Compute from back when EA (or, as they called themselves then, "EOA") first started, that had a black/white photo of the main coders next to the info about their game... they were really pushing it as a place where coders could be free to code, and for them to get credit, not just the company... kind of like, a few years ago, Ion Storm claimed (and failed miserably) to be, as well as Godgames... It was really a big deal and especially nice for Atari folks as the majority of their stuff was Atari-only, and I remember at least one interview where they specifically said that the Atari was the only computer that could do what they wanted to do. (Here's a question - did later versions of MULE, for the C64, etc, still call it "Planet Irata"? I've always wondered but never enough to bother to find out the answer. :)

Good point but now how do you copy those disk images onto the 1050?

Most ATR images I've come across won't copy with my DOS 2.5. Is there a
disk image of a program that will duplicate copy protected images?

Sure, the AXIOM on the ROM is a dead give away.

Axiom was a cheap printer maker. They manufactured some of them with built in daughter cards to interface directly with Atari SIO. Print quality was really bad. I had one of their 7 pin<vs. 9 pin print heads that everyone else used> models that I used for printing docs and had it attached to my BBS.

1310. SIO conntector

Hello,

I need a little help with this game.
I don't have any manual for this game, so I don't know what to do.
To complete the first level was no problem.
But now I stuck in the 2nd level and there seems no way out.
Thanks for your help.

Rob

Yes, this is an annoying compatibility issue. Even if an 800 has 64k
(as mine does) there is a lot of XL/XE software it won't run,
including (I believe) all the XE cartridges.

1314. FA (Ebay) - Atari floppies - free ship for NG (ends Saturday)

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-01 22:58:26 UTC

I am currently selling off all my original Atari Floppy disks. Almost all tested out working, and all are described and pictured. Almost all have the original manuals/documentation. For "payment" for allowing me to put these few ads up, I am offering free shipping on these auctions to anyone from the newsgroup. Just mention that you saw my free ship offer from the NG after you win. Here is the link to my auctions and a list of all Atari stuff available along with the bid price as of 6:00pm Friday. Most of the good games have gotten bids. The best game that hasn't been bid on yet is Tomahawk. It's a really good helicopter gunship simulator. Thanks for looking!

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?MfcISAPICommand=ViewListedItems&userid=bobbyshaw%40aol.com

Flight Simulator II lot - No bids (starts at $1.00)
AdventureWriter - $1.00
Archon - $3.25
Archon II: Adept - $1.00
Atari Word Processor - $15.50
1st Book of Atari Graphics - $1.25
Basic Compiler - $2.25
Bruce Lee - $3.75
Choplifter! (nonworking) - No bids (starts at $0.01)
Computer Football Strategy - No bids (starts at $1.00)
Controller - No bids (starts at $1.00)
Deadline - $3.25
Family Cash Flow 2.0 - No bids (starts at $1.00)
Fight Night - $1.00
Filemanager + - No bids (starts at $1.00)
Financial Wizard - No bids (starts at $1.00)
Guild of Theives - $1.00
Infiltrator - $1.00
L.A. Swat/Panther - No bids (starts at $1.00)
Maxwell Manor - No bids (starts at $1.00)
My First Alphabet - No bids (starts at $1.00)
Program/Text Editor - No bids (starts at $1.00)
Pinball Construction set - $1.00
The Quest - $2.25
Seven Cities of Gold - $10.50
Shootout at the OK Galaxy - No bids (starts at $1.00)
Starcross - $2.25
Starfire/Fire One - $1.00
Summer Games - $5.50
Super Huey - No bids (starts at $1.00)
Tanktics - No bids (starts at $1.00)
Temple of Apshai - $1.00

Tomahawk - No bids (starts at $1.00)
Zork II - $2.75
Original Suspended map - No bids (starts at $0.01)
Original Silent Service Manual - No bids (starts at $0.01)
Hitchhikers Guide inserts - No bids (starts at $0.01)
Juggles House Manual - No bids (starts at $0.01)

I don't know where on the planet you are, but ABBUC in Germany sells the
cables for 7,20 Euro.

Goto: http://www.abbuc.de/shop/index.html

The site is in German, but you can send the "shop-master" a mail in English
for more info about shipping an such. Don't know where to get SIO sockets.
You may want to search for dead tape-drives. The 1010 is the best for this
purpose since it has two of them built in and there are plenty of them.

I'm looking for a complete Atari 5200 4-port system with games and controllers. They are somehow hard to get in Europe, and since I don't like EBay I'll try it over here.

So, anyone knows a working system for sale in the USA? Let me know (fox-1 AT aq DOT nl).

1320. Moving player graphics vertically

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-02 02:43:18 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <OQWf8.107144$2v1.2890025@e3500-atl1.usenetserver.com>
Source record: 30940

I've started back programming the 8-bit wonder.

Now I was reading up a bit to refresh my memory, and I saw in a book someone describing how to move the player data vertically. He was saying to erase the data then draw it back into the new vertical position (in memory). This was kind of inefficient.

I remembered how I use to do this. Instead of erasing the player I would conceptually think of the player's height as being the number of pixels I wanted it's position to be moved by vertically (the delta Y) + the player's actual height. Then depending on whether I was moving the player up or down I would simply blit (or mem-move) the player data bytes + the delta Y in blank (zero) bytes into the new location. What this effectually does is draw a slightly larger player in the new Y position with the delta Y bytes overwriting the remaining player data in it's previous position.

This is more effecient than first erasing the whole player and then redrawing the whole player in a new delta Y position, when only the delta Y pixels need to be erased, not the whole player.

I'm surprised that a book wouldn't teach this method. The trick is to think of your player's height as delta Y longer above and below. In those delta Y pixels define the data to be zero for the player. Then to move the player all you have to do is a blit to the new Y location in memory from the player's data without even having to bother with erasing it first.

Does anyone know of a better way of moving player graphics vertically? I am going to start making some assembler routines for Atari basic to do all this stuff.

My goal is to offer as many RELOCATABLE assembler routines stored in basic strings that can be called from Basic using the USR function to make game programming accessible to the basic programmer. I realize there must be quite a bit. But I'm going to do my own as a hobby and to bring back my past glory (see Antic Vol. 7. No. 7 game of the month at www.atarimagazines.com)

I remember I had redefined character sets, created a display list interrupt for the graphics mode and the scores. I am going to emphasize on effecient relocatable machine language routines for player and missile manipulation first using techniques like the above. And I'm going to create a player editor for sure, that will generate the basic data statements for the player data if I don't find a good one out there somewhere.

This is going to be cool.

Well, I'm in the United States, so that's probably out due to shipping
costs.
Even just a source on the cables would be great.

Thanks!

Its an optimization of the erase first technique. Anyone who tried to
do plot/drawto animations will pretty quickly evolve their techniques
into something similar to avoid the flickering. You might be better
off to avoid the bother and do the vertical player moves during VBI if
you can afford the cycles. Thats where elegant coding to trim cycles
might really pay off. Perhaps a VBI routine that manages
simultaneous, arbitrary motion of all players via respective X and Y
registers? If you got fancy, you might implement a way to set X/Y
velocities instead of just position. It would also be a handy way of
animating player bitmaps &/or color.

> quite a bit. But I'm going to do my own as a hobby and to bring back my past

The one I liked most was the Atari Basic string hack where a 2k string
was dim'ed as the first instruction of a program, then a magic 2
instruction invocation was used to initialize the string and later to
move the player data around. Probably slower then a USR call to
carefully constructed code, but pretty darn cool.

I always liked 6502 Assembly, all the processor needs to be quite nice
is a few more registers, a relocatable stack and on the Atari, more
page 0 addresses reserved for the user. Have fun!

I would think the answer is all of 'em. Any Atari Company or
third-party drive that can be used with any other Atari 8-bit
should be useable with the 65XE. However, you might not have
enough RAM to comfortably run a DOS program on the 65XE. Check
to make sure it's been upgraded to at least 48K RAM.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

The 65XE has 64k, just like an 800XL.

There should be room enough for DOS, unless a Ramdisk is also required.

Could be you were thinking of a 600XL?

Take care.

1327. VHDL code for C025953 for 130XE

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-02 15:57:15 UTC
From: Christopher Lang <christopher.lang@plus.cablesurf.de>
Message-ID: <a5qsp9$1dj$1@goliath.news.is-europe.net>
Source record: 30848

Hi there,

check out the link below and let me know whether you think it is usefull. With that VHDL code you can make your 130XE do 6 different types of memory expansion. Just replace all memory chips in the 130XE with 256kbit ones. I used the Lattice eval VHDL compiler to get it compiled for a GAL6002.

The other good thing about this file is that if you only use the 130XE compatibility portion of the code you basically can do your own C025953 by using a GAL 6002. And it tells you how the C025953 works...

The schematics are still missing on the page, but by looking at the comments in the VHDL file you should be easily able to understand how to connect the GAL in your 130XE.

http://home.cablesurf.de/christopher.lang/atari-8-bit/

Feel free to copy and modify, but let me know if you do something cool with it.

regards
Chris

I used to have one, but sent it off to another collector :(Nice little machine.

I would think that you could use the 1050 with no problem, although I never tested mine with one. It has the SIO port, so why not?

ok,
english:
In every odd level you have to light all the lanterns with the forks (like
you did).

In every even level you have to collect all the diamonds,
but the foes can take it away, so you have to search on!

And if the lightning starts, you have to search for a woman and touch her
;-)
because you can't take any diamonds as long as the lightning goes on.
...
deutsch:
In jedem geraden level musst du alle Laternen mit den Fackeln anz�nden (wie
du es schon gemacht hast).

In jedem ungeraden Level musst du alle Diamanten sammeln,
aber die Gegner k�nnen sie dir abnehmen, dann musst du weitersuchen!

Wenn es blitzen anf�ngt, musst du eine Frau suchen und sie ber�hren ;-)
weil du keine Diamanten mehr aufnehmen kannst solange es blitzt.
...
Hope that helps/Hoffentlich hab ich dir geholfen!
BTW: Two-player is much more fun / Zwei-Spieler macht mehr Spass ;-)

I had a 65xe for years that booted every program I had. I used it with
a 1050 and a 810 disk drive with out any problems.

>
> then type
>
> ENTER"D:DIR

Mirko, you are right. I suggested RUN"D:D but that will not work,
the command name is ENTER as you say. In order to speed up typing,
it is possible to abbreviate it to

E."D:D

if I remember it correctly. Of course, the file name has to be
"D" then, not "DIR".

And yes, the memory is not wiped out. The BASIC input/output
commands really are powerful!

The most common that works is probably the Atari 1050 diskette
drive unit, for 5.25 inch floppies. The design of the 1050 matches
the XL series of computers and peripherals. I think there is a
diskette drive that has the XE look. Gray, modernized design.

You can also use the Atari 810 unit that matches the Atari
400, 800 design. Unmodified 810 units offer 80 kilobytes of
storage capability, while the 1050 offers more, close to
130 kilobytes I think.

You cannot use drive units matching the ST series of computers
with the 65XE. The ST drives can be regonized by looking at the
diskette format. They are all for 3.5 inch diskettes.

If you need more information, post more details.

Oh yeah, I can agree with that. I have a number of EA's early eight bit
games and I love them. Too bad Trip decided not to support the Atari
line later on.

: What Atari Disk Drives can be used with an 65XE ?

From the FAQ http://www.faqs.org/faqs/atari-8-bit/faq/

Floppy disk drives designed for the 8-bit Atari computers:
Atari 810 SS SD
Atari 1050 SS SD/ED
Atari XF551 DS SD/ED/DD, 38.4Kbps burst mode
Access Unlimited ATAR88-1 SS SD master
Access Unlimited ATAR40-1 SS SD/DD master
Amdek AMDC I SS SD/DD uses flippy Amdisk III 3" disk/carts,printer
port,master
Amdek AMDC II SS SD/DD dual drives, printer port, master
AS SN-360 DS SD/ED/DD
Astra 1620 SS SD/DD dual drives
Astra 2001 SS SD/DD dual drives
Astra Big-D DS SD/DD dual drives
Astra The One DS SD/DD, printer port
B&C 810 SS SD, optional Happy Warp Speed 52Kbps
Concorde C-221M SS SD/DD master
Concorde C-222M DS SD/DD master
CSS Floppy Board, for the Black Box, master, support PC 720K and 1.44MB 3.5"
drives, support PC 1.2MB and 360kB 5.25" drives,
also read/write 5.25" and 3.5" MS-DOS disks
see: http://www.nleaudio.com/css/products/floppy.htm
High-Density Disk Interface (HDI) a PCB master,connect up to 4 standard drives
Indus GT SS SD/ED/DD, Synchromesh mode usable with SpartaDOS X
and DOS XL only. 72Kbps under SpartaDOS X, 37Kbps under DOS XL. Z-80 cpu
RAM-Charger--expansion card contains 64K RAM + software, for CP/M support
KARIN MAXI DS SD/ED/DD/QD
L.E. Systems LEDS5-01 SS SD/DD master, 134.4Kbps, 800 only
CP/M expansion: 4MHz Z80, 64K RAM
L.E. Systems LEFDC-04 SS SD Four drives, copies a disk in 22 secs, 800 only
L.E. Systems LEFDC-08 SS SD Eight drives, copies a disk in 22 secs, 800 only
LDW Super 2000 SS SD/DD, 19.2Kbps or 67Kbps
image: http://romualdl.multimania.com/images/atari/super2000.jpg
LDW CA2001 SS SD/DD, 19.2Kbps or 38.4Kbps "California Access"
image: http://romualdl.multimania.com/images/atari/ca2001.jpg
LDW CA2002 DS SD/ED/DD,19.2Kbps,70Kbps w/SpartaDOS. "Calif. Access"
Micro MainFrame MF-1681 SS SD/DD, printer port, 4K to 54K printer buffer,
hard disk firmware included, master, Z-80 CPU w/ 16K to 64K RAM for CP/M,
TRSDOS, MaxiDOS A, and OASIS. see: http://www.qnet.com/~dons/mmf.html
Micro MainFrame MF-1682 dual drives version of MF-1681

Percom RFD40-S1 SS SD/DD, master
Percom RFD40-S2 SS SD/DD dual drives, master
Percom RFD44-S1 DS SD/DD, master
Percom RFD44-S2 DS SD/DD dual drives, master
(80-track RFDs hinted at
http://www.atarimagazines.com/v1n2/newproducts.html
Percom AT88 SS SD, master
Percom AT88-S1 PD SS SD/DD, printer port, master
Percom AT88-S2 PD SS SD/DD dual drives, printer port, master
Rana 1000 SS SD/ED/DD, stand alone disk formatting
RCP 810 SS SD
San Jose Computer Special Edition 810 SS SD, optional Happy Warp Speed 52Kbps
SWP ATR8000 4MHz Z80, 16K RAM, RS232, master, printer port
or 4MHz Z80, 64K RAM, RS232, master, printer port, CP/M 2.2
options: 128K or 256K CO-POWER-88 with MS-DOS; CP/M-86
TOMS 720 DS SD/ED/ID/DD/QD/ID printer port, MYDOS 4.50 on ROM, 70Kbps
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
TOMS 710 DS SD/ED/ID/DD/QD/ID printer port, MYDOS 4.50 on ROM, 67Kbps
one more format: double sided, 80 tracks, IBM (720 KB)
also TOMS Navigator on ROM (like Norton Commander).
Trak AT-1 SS SD/DD master.upgrade: printer port+4K/16K buffer
Trak AT-D1 SS SD master, printer port, 4K print buffer.upgrade:16K
Trak AT-D2 SS SD/DD master, printer port, 4K print
buffer.upgrade:16K
Trak AT-D4 DS SD/DD, printer port, print buffer
Trak Champ SS SD master
Trak Champ2 SS SD/DD master
Trak AT-S1 SS SD/DD slave
XFD601B DS SD/ED/DD 70kbps,Top Drive,Synchromesh,UltraSpeed,XF551 compat.
XFD602B dual DS SD/ED/DD 70kbps,Top Drive,Synchromesh,UltraSpeed,XF551 compat

While any standard "slave" drive will work with "master" drives listed above,
the following are slave drives marketed specifically to Atari users:
Access Unlimited ATAR88-A1 SS SD slave
Access Unlimited ATAR40-A1 SS SD/DD slave
Concorde C-221S SS SD/DD slave
Concorde C-222S DS SD/DD slave
Percom RFD40-A1 SS SD/DD slave
Percom AT88-A1 SS SD/DD slave
RCP 100 DS SD/DD, slave
RCP 200 DS SD/DD dual drives, slave

Mostly flying in the dark here, Andreas. I got mine used; just the board and one disk (not original) with patched DOS 2.0 using D4: as only option for 707 sector ramdisk.

I know it is 128K and designed for the center 800 memory slot. I believe it swaps 16K blocks in the $4000-7FFF area using some $C??? addresses as control. It has a switch on one corner to disable the extra 112K and appear as stock 16K board.

I think someone patched Dos 2.5 for Axlon use, but I had converted to MyDos 4.5 before I heard about it. MyDos gives 883 sectors out of that 112K

Hmmm..MULE was a damn fine game but it's a little OTT to call it
'state of the art'. It's a basic trading scenario executed with great
style.

PSC was very good but I preferred Davids Midnight magic tbh..

I don't know if this helps but I have the ICD SpartaDOS Construction Set.

It's still sealed in package with two books and two disks.

Maybe this DOS can be altered easily or something, I don't know.

optonline dot net) scribbled:
->The 65XE has 64k, just like an 800XL. ... Could be you were think-
->ing of a 600XL?

Yeah. But still, if I got hold of a 65XE the first thing I'd
want to do after getting it connected up would be to check to make
sure it had the full complement of (at least) 48K RAM! <grin!>

I love Hard Hat Mac. Anybody got the full color version ? I have the
original European release and it's black and white (artifacted in US), but
have seen it in color.

Yes, that's because last time I replied to one of your messages I received an e-mail suggesting I not quote your whole message. Would "yadda yadda yadda" be less offensive?

B&C Computervisions has been around a long time (I've got an 810 sitting next to me with their receipt still attached...1990) and they don't slam an important part of the Atari community - auction sellers.

Source record: 30869

Hello All,

I hope the sysop of JYBOLAC BBS or somebody close to him reads this soon.

A few days ago, I logged on to the board for the first time, after months of trying. I put in all my info, received a user number, and asked the board to register my password at logoff as requested.

Now, when I try to log on, the board accepts neither my user number nor my name, and the only other option offered to me is logoff.

I hope this situation can be corrected, as it's apparent that nobody logging on can get anywhere with the board.

Thanks.

Alan

Source record: 30873

Hello,

I just recently acquired an Atari 800, Atari 400, 1050 Disk Drive and 810 Disk Drive.

I'm very excited to get these computers running, but do not have any software (more importantly DOS).

Can someone point me in the right direction? I've tried Ebay, but there isn't anything listed at the moment. I've read the Atari FAQ for transferring files, but that goes over my head.

Is there someone out there that has a dummies guide to transferring the files between a windows machine and atari? Is there someone out there that can help me out with some old software?

Thank you,
Mike

Well,
use the selftest (with Basic off) and you will see 48k RAM plus 16k ROM.
And if you have a newer 65XE (eastern europe) and upgraded it to 128k
RAM, you will also see 4 more blocks, which represent the 4 additional
rambanks...
-Andreas.

Subject: 7.7) Are there Graphical User Interfaces (GUIs) for the Atari?

add:
- Atari Desktop by ABC software (Poland), includes editors, converters,
file copiers, sector copy, tape+turbo tape copy, small games, CMC finder
and player and much much more; works with 64k RAM and keyboard input;
disk manuals only in polish language...

subject x.x (four player games)?
add:
- Volleyball, a PD game written in Atari Basic; 4 players with 400/800
Atari;

1355. Atari ramdisk infos updated...

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-04 11:22:24 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3C8358F0.55215CB3@students.uni-mainz.de>
Source record: 30877

Hello Folks,
my compilations of a) the Atari ramdisks, b) programs that support a RD
and c) programs that require a RD have all been updated. Here is the
first update:
(Hope you can include this new version, Michael)

3.7 Atari Ramdisks - a short & very incomplete Overview:
(This is version 1.2 from March 2002)

Right from the start of the Atari 8-bit computer era in the late 70`s,
Atari users wanted to have as much RAM as possible (or as their purse
could afford). Having a 16k machine with a tape device was nice and
cheap, but having full 48k or 64k and a floppy drive was much nicer
(and very expensive). Thus many Atari users began to create selfmade
RAM
extensions and enhancements, just to save some money. Also a lot of
firms
provided extra RAM, RAM enhancements, RAM extensions and Ramdisks.
Besides Atari there were (and still are) quite a lot of producers,
manufacturers, distributors and authors of such RAM enhancements...

This short and incomplete overview does not provide any docs or
manuals,
but gives some info about the various Ramdisks on the market. Since
these
notes are written by me, they will merely contain the information I
have.
And as you all can see - it isn`t much information. So any help and
extra
info, as well as corrections, are very welcome. It would be nice to see
this text & info growing. For now let us start here, the info-section
is divided into 8 groups:

1) Name (Name of the RD, e.g. Megaram 2 or Rambo XL or MIO, etc.);
2) Vendor/Author (or distributor, manufacturer, producer, etc.);
3) Size (size of the Ramdisk only; NOT the full computer memory);
4) [Bankswitching] Area (for XL/XE computers usually 4000-7FFF);
5) Banks (hexadecimal input count, as in MyDOS or RAMDTEST.BIN);
6) Control Bits (which bits are used to control the RD);
7) Port (control Port - usually Port B for XL/XE machines);
8) Notes (any extra info, comments, miscelleanous things, etc.);

If you wish to add any other type of info, let me know. The above
information should be enough for most programmers to support a RD in
their programs (especially to support more than just one type of RD).
Hopefully future programs will take care about this info or just use

a small setup program to setup any kind of RD. Now let me begin:

X.1 Atari 400/800 Ramdisks:

Name Vendor Size Area
Banks Bits Port Note

- Axlon Axlon/Atari 64k C000-FFFF
unknown unknown ? (CFFF) plug-in-board

- Axlon Axlon/Atari 128k C000-FFFF
unknown unknown ? (CFFF) plug-in-board

- Mosaic unknown 64k C000-FFFF
unknown unknown ? (CFFF) plug-in-board

- Mosaic unknown 128k C000-FFFF
unknown unknown ? (CFFF) plug-in-board

- Peterson P.Peterson 64k-1024k C000-FFFF
unknown unknown ? (CFFF) selfmade-RD

- ...

X.2 Atari XL/XE Ramdisks:

Name Vendor Size Area
Banks Bits Port Note

- 130XE-RD Atari 64k 4000-7FFF
E3,E7,EB,EF 2,3 B ($D301) old=8kbyte Chips (west);

E3,E7,EB,EF

- Newell Newell Ind. 1024k 4000-7FFF
[0,2,4,6, 1,2,3,5,6,7 B ($D301) uses 8 pc. 1Mx1 Chips
(511000-70),
8,A,C,E] separate Antic/CPU: no!
[1,3,5,7, if full 1MB is used, then
Basic
9,B,D,F] and Selftest are not
avaiable;

- Newell Patch by E.P. 1024k 4000-7FFF
[0,2,4,6, 1,2,3,5,6,7 B ($D301) uses 8 pc. 1Mx1 Chips
(511000-70), 8,A,C,E] modified by
Erhard Puetz (how?),
[1,3,5,7, full Basic and Selftest
control;

9,B,D,F] separate Antic/CPU: no (?)

- Newell Newell Ind. 4096k 4000-7FFF
[0,2,4,6, 0,1,2,3,5,6,7 B ($D301) uses 8 pc. 4Mx1 Chips (?)
8,A,C,E] separate Antic/CPU: no!
[0,1,2,3, Basic/Selftest: no !
4,5,6,7,
8,9,A,B,
C,D,E,F]

- TOMS-RD T.O. + M.S. 256k 4000-7FFF
83,87,8B,8F unknown B ($D301) made+standard in Poland;
A3,A7,AB,AF used/supported in most
C3,C7,CB,CF polish demo programs;
E3,E7,EB,EF separate Antic/CPU: no!

- TOMS-RD T.O. + M.S. 512k 4000-7FFF
03,07,0B,0F unknown B ($D301) made in Poland;
23,27,2B,2F separate Antic/CPU: no!
43,47,4B,4F fully Newell compatible;
63,67,6B,6F
83,87,8B,8F
A3,A7,AB,AF
C3,C7,CB,CF
E3,E7,EB,EF

- TOMS-RD T.O. + M.S. 1024k 4000-7FFF
[0,2,4,6 unknown B ($D301) made in Poland;
8,A,C,E] separate Antic/CPU: no!
[1,3,5,7 Basic/Selftest: no (?)
9,B,D,F] Newell compatible;

- missing info for the following Ramdisks:
Atari Magazin 256k, Bob Wooley RDs, P.Peterson 256k-1024k,
Rambo XL, ABBUC/Buchholz 192k and still many many others...

X.3 PBI-devices (XL=parallel Bus, XE=cart. Port+ECI):

Name Vendor Size Area
Banks Bits Port Note

- no information yet!
- missing info for the following Ramdisks:
ICD MIO (256k, 1024k), Yorky XL (256k), Turbo-Freezer XL (256k),
the Atari 1090 (this one should also have had a 64k extra RAM
expansion card), R.David/K.Peters Romdisk (512k) and many many
other PBI devices...

X.4 other Ramdisk types and devices:

Name Vendor Size Area
Banks Bits Port Note

- no information yet !
- missing info for the following types and devices:
Flashrom (512k), Rambox (64k+128k), Ramcart (64k-4096k), CP/M card
(with 64k extra RAM avaiable), ATR 8000 (also had 64k extra RAM),
Turbo 65816 (or 65801 / 65802), ARGS Romdisk cart. (64k) and many
other types...

For this second edition special thanks go to: Lee Barnes, Russ Gilbert,
Mathy van Nisselroy and Erhard Puetz for sharing their info with me.
Well, thats it for today - it still ain`t much I know, but any help is
very appreciated. If you have some info, notes, corrections or other
things
that might help, let me know. Thank you - Andreas Magenheimer.

1356. Atari Ramdisk info updated...

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-04 11:30:38 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3C835ADE.221EFDF7@students.uni-mainz.de>
Source record: 30878

Hello folks,
here is the second update of my RD compilations...
(Still hope you can include it, Michael; contains some new infos, as
well as additions and updates...) -Andreas.

8.12 Atari programs which need extra Ram / Ramdisk:
(This is version 1.2 from March 2002)

The memory values given are not always fully correct, since I do not
have all kinds of memory settings or Ramdisk types. At the moment I
merely have machines with 64k, 128k and 320k memory. Thus I cannot
tell if a program may work with 192k or 256k (or more than 320k), since
I do not have such machines. Any help or correction is welcome...

8.12.1 non-Demo programs:

- T-34 by Mirage/ANG needs 128k memory (a 130XE is enough);
- Mister X by Power per Post needs 128k memory (130XE);
- Castle of Blackthorne by thimo Graef needs 128k memory;
- Gizmo`s Castle by Black Panther is avaiable in two versions:
the 64k version and the 128k version; if youu have the 128k
version you will need a 130XE or compatible machine;
- Oelbaron by ??? (author unknown) also comes in two versions:
a 64k and a 128k version; a 130XE or comp. is needed for 128k;
- Boss-XE by Mirko Sobe needs 128k minimum memory (XE or bigger);
- Boss-X by Mirko Sobe needs 128k minimum memory (XE or bigger)
- MTOS 1.0 and 1.1 by Tom Hunt need 128k memory (XE), there is
also a 256k version of MTOS (64k RAM + 192k RD; probably Newell?);
- Snapshot by ??? (author unknown) needs 128k minimum memory;
- XL2 by J.K. Picken needs 128k minimum memory; supports also
bigger XE-comp. machines up to 1MB (?);
- the CTH-Sound-Utility by Tom Hunt (a Wave+DIG Player) supports
64k, 128k, 256k, 576k and 1088k machines; uses 16k RAM+RD for the
Digi-Sound, thus a 64k machine is often to small!; does not support
320k machines, nor Compyshop-RDs;
- Datei 4.0 and 4.1 by ??? (author unknown) both support 128k (XE)
and 320k (Compyshop) machines;
- various Filemanagers/Filecopiers support XE-comp. Ramdisks;
i.e. you need 2 drives if 48 or 64k RAM, only 1 drive + RD if
extra Ram / RD is avaiable;
- various 130XE-test programs need 128k RAM, e.g. for bankswitching
tests and/or other things (can be found in many magazines);
- various System-test programs support 48k or 64k as well as extra
RAM; since they were (mostly) written to detect the extra RAM /

Ramdisk, you "should" have more than 48k or 64k memory...;
- some XE-Sectorcopiers absolutely need a minimum of 128k RAM;
- there are also some Tape programs (Tape-Disk-Copier, Tape-Tape
Copier, Disk-Tape-Copier, etc.) that need a minimum of 128k RAM,
for example VampireSofts 130XE Coolcopy and others;
- there are also some Tape-Ramdisk programs or drivers (which provide
a RD for the Tape users) that need 128k minimum memory;
- no more ideas...

8.12.2 Demo programs:

- Amiga Boink XE by ???, minimum 128k RAM; XE=yes, CS=yes;
- American Natives Demo by FOX-1, needs 256k RAM; XE=no, CS=yes,
AM=yes;
- Asskicker by Shadows, minimum 128k RAM; XE=yes, CS=yes;
- Anime-4ever by ???, minimum 320k RAM; XE=no, CS=yes;
- Base33 by AIDS, minimum 320k RAM; has a RD-setup menu;
- Bill-Pie-Demo by ???, minimum 128k RAM; XE=yes, CS=yes;
(uses $05 banks with $36 frames or $0D banks with $96 frames)
- BMW-Ani by Mirko Sobe, minimum 128k RAM; XE=yes, CS=yes;
- CES-Demos by XANTH (full version) needs 128k RAM; XE=yes, CS=yes;
- Cogito by AIDS, minimum 192k RAM; XE=no, CS=no;
- Comet-Demo by Madteam needs minimum 128k RAM; XE=yes, CS=yes;
(uses $05 banks with $36 frames or $0D banks with $96 frames)
- Danielle-Gr.9-Ani by Bill Kendrick should load off of a RD or a
Harddisk (Floppy is verrryy slowww); for a RD-machine 128k total
memory is enough; XE=yes, CS=yes;
- Ergo-Bibamus by Quasimodos, minimum 128k RAM; XE=yes, CS=yes;
- Glashead/HTPPD by AR+CSS, minimum 320k RAM; XE=no, CS=yes;
- Grafik+Sound-Demo by P.Sabath needs 128k memory; XE=yes, CS=yes;
(many different versions, there is also a 64k version avaiable;)
- Halle 1994B (Wormhole) by AR+CSS, needs 320k?; XE=no, CS=yes;
- (Atari) Hardware-Demo by AR+CSS, needs 320k RAM; XE=no, CS=yes;
- I.B.R.-Demo by MacGyver/AIDS, needs 256k RAM; has a RD-setup menu;
- Igor, Side A by Madteam needs 128k minimum RAM; XE=yes, CS=yes;
- Igor, side B by Madteam needs 192k minimum RAM; XE=no, CS=yes;
- Journey by Polynomials needs minimum 128k RAM; XE=yes, CS=yes;
(uses $05 banks with $36 frames or $0D banks with $96 frames)
- Khai-Et by AIDS needs 320k minimum RAM; XE=no, CS=yes;
- Killer-Whales by Madteam needs 320k minimum RAM; XE=no, CS=yes;
- Lajf-Demo by Madteam needs 128k memory; XE=yes, CS=yes;
- Megablast-Sounddemo by DGS needs 128k memory; XE=yes, CS=yes;
- Muppet-Movie by Madteam probably needs 128k memory?; XE=yes, CS=yes;
- Nascar-Ani by Mirko Sobe needs 128k memory; XE=yes, CS=yes;
- Nonejm by Tight (pre-release) needs 128k memory; XE=yes, CS=yes;
- Owca-Demo by ??? needs 128k memory; XE=yes, CS=yes;
- Owca-2 Demo by ??? needs 128k memory; XE=yes, CS=yes;
- Parrot-X-Mas-Demo by A.Ramos needs 128k memory; XE=yes, CS=yes;
- Pedrokko-Parrot-Sounds (10 Disks / 20 Disksides by Pedrokko)

need 128k memory; XE=yes, CS=yes;
- Raving Vierpz by Pentagram needs 128k memory; XE=yes, CS=yes;
- Raytracing XE by K.Pelzer needs 128k memory; XE=yes, CS=yes;
- Raytracing 320k by ??? needs 320k memory; XE=no, CS=no, AM=yes;
- 1MB Raytracing-Demo by ??? needs 1088k memory; XE=no, CS=no, KP=yes;
- Revenge of Hacker by Rasero Team needs 320k minimum RAM; XE=no,
CS=yes;
- Sweet Fantasy by Tight needs 128k memory?; XE=yes, CS=yes;
- Sheol by Bit Busters needs minimum 320k RAM; XE=no, CS=no;
- Shiny Bubbles by ??? needs 128k memory; XE=yes, CS=yes;
(there is also a shortened 64k version avaiable);
- Stash-Demo by Rasero Team needs 320k minimum RAM; has a RD-setup
menu;
(first use B for manual choice, then again a) for TOMS or c) for any
other type of RD; do not use b) for Compyshop, since it is faulty!)
- Starwars-Demo by AR+CSS needs 320k minimum RAM; XE=no, CS=yes;
(always boot with Option/Basic off, to avoid stripes...);
- Timekeep(er) by New Generation needs 320k RAM?; XE=no, CS=no;
- Tit-Demo by Madteam needs minimum 256k RAM; has a RD-setup menu;
- Too-Hard-2 by Animkomials needs 128k memory; XE=yes, CS=yes;
- TheTop-3 (Veronika Part) by WFMH needs 128k memory; XE=yes, CS=yes;
- Total Dazed by Tight needs 128k memory; XE=yes, CS=yes;
- Trabant/HTPPD by AR+CSS needs minimum 320k RAM; XE=no, CS=yes;
- Trip6-Demo by Shadows needs 128k memory; XE=yes, CS=yes;
- Ultra by Taquart needs 128k memory?; XE=yes, CS=yes;
- Vengeance by Excellent needs 128k memory; XE=yes, CS=yes;
- Vent by Exc.+Pent. needs 128k memory; XE=yes, CS=yes;
- Video Blitz by Helvetica Bold needs 128k memory; XE=yes, CS=no;
(also needs separate Antic/CPU access, which most RDs do not have);
- WAF-Demo, Side B by WAF members, two parts need 128k memory
(Raytracing and Vector Part); XE=yes, CS=yes;
- Worms-Demo by Datri needs 320k minimum RAM; XE=no, CS=no;
(on a CS-RD you can see the ani with many bugs);
- X-Demo by Madteam needs 320k minimum RAM; has a RD-setup menu;
- X-Files Demo by ??? needs 128k memory; XE=yes, CS=yes;
- XE-Demo by ??? needs 128k memory; XE=yes, CS=yes;
- XE-Demo by SAG needs 128k memory; XE=yes, CS=yes;
- Xyberscape-XE by Bill LeMasurier/TAF needs 128k memory; XE=yes,
CS=yes;
(there is also a 64k version avaiable separately);
- Zero-Demo by New Generation needs 128k memory; XE=yes, CS=yes;

Note: - XE means 130XE Ramdisk (size: 64k);
- CS means Compyshop Megaram 1 or 2 (size: 256k);
(schematics avaiable from ABBUC)
- AM means Atari Magazin Ramdisk (size: 256k);
(schematics can be found in AM 2/1987)
- KP means Klaus Peters Megaram 3 (size: 1024k);
(schematics avaiable from ABBUC)

- TO means TOMS Ramdisk, NE means Newell Ramdisk;
since both are "compatible", programs should work
on both Ramdisks (no programs listed yet, see below)
- has a RD-setup menu means, that you have to hold
down SHIFT upon bootup to get the setup-menu; here
it should be possible to setup any XE-compatible RD;
- I could only test XE and CS Ramdisks, since
I do not have any other kinds of RDs;

Thats all so far. Any additions or corrections are welcome.
Greetings, Andreas Magenheimer.

1357. Atari RD info updated...

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-04 11:36:26 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3C835C3A.D3EEA6EE@students.uni-mainz.de>
Source record: 30879

```
Hello folks,
here is the third update of my compilations...
(well, some programs have been erased here and placed into the RD
required section...) greetings, Andreas.

8.12 Ramdisk-supporting Software:
(This is Version 1.2 from March 2002)

Well, I will only list commercial or former commercial programs here,
that have built-in ramdisk support. Why? Simply, because most if not
all
PD programs can support a RD, as soon as the user a) has a special DOS
or RD driver or b) has a special OS inside the computer or c) has any
kind of special and non-standard hardware. Just one example: With the
use
of QMEG+ OS it is possible to freeze ZORK (or any other protected /
unprotected program) into the RD, then re-direct the RD as being drive
1
and finally boot Zork off of the Ramdisk, allthough Zork does not
support
a RD in any way. The same funny things can be done to other copy
protected
programs and especially to unprotected public domain programs...
Ok, enough said, let me begin:

---------------------------------------------------------------------------

8.12.1 DOS programs:

- Atari DOS 2.0 (selfmade RD drivers for Axlon and XE avaiable);
- Atari DOS 2.5 (driver for XE-RD and various selfmade drivers);
- MyDOS (supports Axlon and XE compatible Ramdisks up to 1MB?);
- Sparta-DOS (supports XE compatible RDs and others up to 1MB?);
- Happy DOS II+D (supports XE compatible Ramdisks up to 256k);
- BiboDOS (supports XE compatible RDs up to 256k);
- TurboDOS (supports XE comp. RDs, MIO, Irata, etc. up to 256k)
- TopDOS (supports XE comp. RDs and Axlon RDs);
- BeweDOS (supports XE comp. RDs and Rambox);
- SuperDOS (supports XE comp. RDs up to 256k)
- guess there are dozens of other DOS versions that support a RD...

---------------------------------------------------------------------------

8.12.2 non-DOS programs:

- Synfile (+) by Synapse supports Axlon-RDs;
- Syncalc (+) by Synapse supports Axlon-RDs;
```

- Synhome (+) by Synapse supports Axlon-RDs;
- other Synapse applications should also support Axlon-RDs;
- A.R.-The Dungeon by Datasoft supports 48k, 64k and 128k (XE-RD);
- Paperclip-II by Batteries Inc. supports 130XE-RDs;
- Atari-Writer-Plus by Atari supports 130XE-RDs;
- Atari-writer-80 by Atari supports 130XE-RDs;
- A-Text 130 or Austro-Text 130 supports 130XE-RDs;
- Page-Designer by XLent supports 130XE-RDs;
- Type-Setter by XLent supports 130XE-RDs;
- other applications by XLent support 130XE-RDs;
- 4bit-Sampler by Mirage/ANG, some programs support 64k, 128k and/or
320k memory;
- The Brundles by KE-Soft supports 64k, 128k and 320k memory;
(hold down/press Select key upon bootup to get the setup menu)
- Lightraces (Tron) by Power per Post supports both 64k and 128k memory;
- Adalmar by Power per Post supports both 64k and 128k memory (?)
- Megablast 1 by Thorsten Karwoth supports both 64k and 128k memory;
- thats all I remember right now...

Note: - Axlon means any Axlon compatible Ramdisk;
- 130XE means only 128k (for more extra Ram you have
to change the program, the DOS or the RD driver);
- 320k memory means any (?) XE-compatible RD with 64k RAM
plus 256k extra Ram / Ramdisk;

Thats all for now. Thanks to Russ Gilbert and Lee Barnes for sharing
some
info with me. Any further help or info is welcome !! Andreas
Magenheimer.

Well,
I guess it is the same as with PCS - only the pirated version is
avaiable in (PAL) color; the originals use color artifaction, thus only
color on NTSC and b/w on PAL; (By the way, the pirated color versions
have been converted from Gr. 8 to Gr. 15). As of yet I only know one
official color conversion: Atari re-released Broderbund`s choplifter as
a Gr. 15 XEGS cart (the other Broderbund games, like DMM and Loderunner
had still been released as Gr.8 XEGS carts).
-Andreas.

1359. DCM format... converter problems...

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-04 12:37:57 UTC

Message-ID: <3C836AA5.5B265B66@students.uni-mainz.de>
Source record: 30881

Hello folks,
this time something for the EMU guys (especially Steve Tucker!), if you are not interested, ignore this post. Well, there are several converter programs which can handle the DCM format, meaning they can convert DCM into XFD, ATR or something else - or just the other way around they can convert ATR,XFD, etc. into DCM format. so far so good. When I used Imagic (DOS version from Steve Tucker) and later ACVT (also DOS version from Jindroush) to convert one and the same ATR image into DCM, I found out that these converters produced different DCM images... (different in size/filelength).

Well, I tested this strange effect with several other ATR and XFD images and so far it looks like ACVT always produces DCM images which are a few bytes (or kilobytes) shorter, whereas Imagic produces longer DCM images. As said before: when converting one and the same ATR (or XFD) into DCM. So, I downloaded the different DCM images to the little Atari and used Diskcommunicator 3.2 to unpack them. Luckily, the diskcom. could unpack both test images, but the shorter ACVT DCM image took only 2 passes to unpack, the longer Imagic DCM image took 6 passes to unpack. But at least both images uncompressed properly...

So, I did another test erasing all ATR and XFD images and using only the DCM images. Next I used ACVT to convert both (longer and shorter) DCM images into ATR and then XFD. This test worked fine, ACVT converted both DCM images properly and most of all the ATR and XFD images had the proper size. Then I deleted ATR and XFD again and this time used Imagic to convert the (longer and shorter) DCM images into ATR and then XFD. Well, Imagic could convert the longer DCM image (produced by imagic itself) into ATR and XFD properly, but it could not convert the shorter DCM image (produced by ACVT) into ATR or XFD properly - it converted them, but the filelengths or sizes were smaller than they should have been...

Conclusion: - Diskcom. 3.2 uses more than one compression method.
maybe ACVT uses all the methods which diskcom uses,
whereas Imagic uses only one method...
- ACVT can convert (and autorepair) all or almost all
images in S/E/D format properly...
- Imagic cannot use/convert DCM images produced by ACVT,
nor can it convert DD ATR images produced by SIO2PC
(size: 184,xxx bytes), only DD ATR images produced by
Atari 800/Win (size: 183,9xx bytes)
- both Imagic and ACVT cannot convert any images that
are bigger than 180kbytes (it would be nice to include
options for 360k, 720k and 1440k; as well as

acknowledge of size differences between SIO2PC and
Atari 800/Win and autorepair if user requested;
you know the size difference in DD formats has to do
with the boot sectors...)

This is not a complaint, just something I found out and a few
suggestions to the authors who wrote ACVT and Imagic... -Andreas.

you could try http://www.computer-cables.com

they are based in the uk.

I got a atari din connector to scart from here for my 800xl and also (as I have a mk2 phillips monitor) a female scart connector to din plug for the mk2). This was a while ago - the cables might not be on the site - but it might be worth emailing/ringing. In some cases I think they will modify cables for you - possibly even make them to order - am not sure. If you ring you should ask to speak to Gary who I've always found knowledgable and really helpful.

By "pure incident", I had to look into the DCMTOATR sources you'll find on the web and checked how DCM "compression" works. It is more or less a sector based run-length compression algorithm with special cases for "start of sector identical" and "end of sector identical". Due to the very nature of this compression method, it is up to the cleverness of the compressor to detect the runs, and therefore to compress better or worse. In worst case, no run length would be considered and the .dcm would be even larger than the corresponding atr. (Luckely, none of the compressors are that stupid ;-).

Conclusion: This is absolutely nothing to worry about and just a matter of the implementation. I'm just wondering why it doesn't use some smarter compression like LZW?

So long,
Thomas

1363. Horizontal DLI colour changes

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-04 17:16:36 UTC
From: atari@mkeates.f9.co.uk
Message-ID: <UZNg8.2875$51.83236@wards>
Source record: 30885

Hi,

Does anyone have some simple !?! examples
of changing colours on the fly.
Hardball did this rather well down the
middle of the screen but presmuably changes
can be done within a few colour clocks.

(http://www.runtime.demon.co.uk/Systems/Atari/Books/DeReAtari/Chapter5.html)
De-Re-Atari mentions using a kernel as
an alterative, any example code of this
method as a comparison?

I'd thought of maybe having a fixed DLI
code portion in which the LDA values were
modifed during the VBI from colour tables.

BTW, the same lines will be using ANTIC and
possibly P/Ms too so timings could be tight,
however the planned graphics are static
which should help as the changes could vary
by a few colour clocks without issue.

Many thanks,

Mark

P.S. 'Elite' progress is still on hold :-(
as baby #2 arrived on Valentine's day
(and so we named her Juilette ;-)

Assuming "withing a few colour clocks" means within one screen
line, I do not think it is possible. My impression is that the
CPU is not allowed to access the memory bus while the ANTIC chip
reads data from RAM.

I would be more than happy if anybody could tell me I am wrong,
because it would be useful to create interesting visual effects.

As a consequence of the restriction I believe is there, it should
be possible to alter the background colour and modify graphics
patterns on one line if ANTIC line generation is disabled, like
with POKE 559,0 in BASIC.

Anders

1365. Re: JYBOLAC BBS

Newsgroup: comp.sys.atari.8bit

Guys,

I am sorry. The userlist got corrupted. I have it mostly fixed now, but those
of you who logged in already have been
"black listed". I can fix this tonight and let you know.
The only drawback is that you will have to re-login again. When
you do, you must give the SYSOP Feedback or Carina will delete
your account after you log off, even if you ask the BBS to save
your account.

And now for a little background: JYBOLAC BBS was a great BBS
here in Dallas standing for 'Just your basic on line Atari
computer' that shut its doors in the late 80s. Greg Goodwin
got permission from the original Sysop to use the name for our
virtual user group:
http://www.geocities.com/doctor_clu/JYBOLAC.html
Since, I am a member with a cable modem and several spare 8bits
I have started modifications to the Carina II code to work well
with APE, Ansi, C64 graphics,etc. It is mostly stable, except
for not save new users....which of course is why not everyone
knows how to log in...YET!! I am sure I will let everyone know
when this Computer Anachronism is robustly online.

>
> Now that I think about it, page flipping would probably work.

If you by page flipping mean switch between text and graphics mode on each vertical synchronization event, it will work, but one will see a noticeable flicker.

It would be possible to use players and missile graphics for the starfield. P/M graphics can co-exist with the text line on the same vertical location.

The most simplistic approach would offer a total of eight stars, which is too little for a starfield.

You can get more powerful P/M handling if you write an interrupt routine triggered by a timer that runs in synchronization with the horizontal line event. This allows the eight stars (the eight players and missiles) to be located on different horizontal positions on different lines.

If you use one of the built-in text modes, it is not possible to trigger your routine with a display list interrupt. That would not allow the necessary fine line division vertically within the text line.

To solve that, you could try and set up a timer that runs in synchronization with the horizontal line event. Not triggered by the display list, but in synchronization with it. (Can anybody write example code for this? I have never done it myself.)

The display list interrupt method can be used if you create your text line using graphics with a high vertical resolution (for example 16 fine vertical lines). In that case, the interrupt part is easy, but you have to build up characters using a pixel mode, so that part becomes more complicated.

1367. Freelance 6502 programmers wanted

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-04 20:22:17 UTC
From: davidlevylondon@yahoo.com
Message-ID: <6f912d1b.0203041222.1efe9150@posting.google.com>
Source record: 30889
Cross-posted to: comp.sys.acorn.programmer,comp.sys.cbm,comp.sys.atari.8bit,comp.sys.oric

From time to time we need 6502 programmers to work on embedded projects such electronic games. Some but by no means all of our projects use synthetic speech (usually ADPCM encoded).

We need to locate a few genuinely enthusiastic and very experienced 6502 programmers who work from home (or their own offices) on a freelance basis. The work is always interesting but we often have periods of several months when our own internal programming resources are sufficient to meet our needs, so work is allocated to outside programmers on a project by project basis.

Our target processor is most often a member of the Sunplus 8-bit family. Sunplus is a major Taiwanese vendor. Some members of the family have a reduced 6502 instruction set, some use the full instruction set.

Just a wait-for-sync (WSYNC?). I forget offhand how it works, but this
is how you can have GRAPHICS 0 text which has a vertical gradient
of 8 shades, for example.

I've just updated the Atari Program Exchange (APX) section of
atariarchives.org. The following APX programs are now available
for download, with the permission of the authors:

Starware
Mapware
Astrology
Mankala
Speed-O-Disk
BASIC/XA
Smasher
T: A Text Display Device
Yahtman
Ultimate Renumber Utility
Bellum
Home Inventory
Keypad Controller
DiskMenu
DrawIt
Catterpiggle
Bootleg
Moon Marauder
Ringmaster
Supersort

Check it out at http://www.atariarchives.org/APX/

> reads data from RAM.

Kind of tired... hope I'm understanding the question.

A similar trick can be done to create 8 P/MGs (sprites) on the
same vertical scaneline.

A DLI occurs at the scanline in question, and a really tight loop
waits for a precise amount of time, and then the graphics settings
are changed (in this case, players are moved, and probably the pointer
in memory where the PMG data comes from... in the case of hardball,
the color palette is changed.)

The same trick has been used to get GR.8, GR.15 and GR.9 all on the
same scanline. (Part of the fact that you can get three is due to a
known 'bug' in ANTIC :))

It's difficult, CPU-intensive, and not as precise as it could be
(so you'd have a zig-zag of flicker down the center of the screen),
so you need to be clever as to where you place things.

In the case of 8 players, it's simple:

0 1 2 3 0 1 2 3

:)

The following wouldn't work too well, though... the center two PMGs
(which are in fact the same) would appear messed up:

0 1 2 3 3 2 1 0
^^^

> Can that be done?

Yes. It's tricky, though. I've seen sometimes where it doesn't work,
unless I reboot and try once more. :) (It definitely fails on emulators.
PCs aren't fast enough to pay attention to any mid-scanline graphics mode
changes :))

> Sounds like just what I need to finish my TV calibration
> program...

Cool! :)

> Is this docuemnted anywhere?

Probably. :) I don't know off-hand, though. Bewesoft's 8-player demo
does it with sprites. One of Our5oft's demos (probably "OUR5OFT.COM")
does it with the three graphics modes.

Here's a screenshot of it, though it's from an emulator, so it failed :)

http://www.newbreedsoftware.com/bill/atari800/our5oft.gif

(Should be GR8, GR9, GR15, from left to right... shows all GR9)

Here's from another demo:

http://www.newbreedsoftware.com/bill/atari800/thebreak.gif

(Should be GR8, GR9... shows all GR8)

And here's the 8-player demo (again, emulated, so it didn't work :))

http://www.newbreedsoftware.com/bill/atari800/demo8pl.gif

I'm always trying all compression methods and finally I use the shortest
output data. If I made no mistake, the files made with ACVT should be
the shortest possible.

> Well, Imagic could convert the longer DCM image (produced by imagic
> itself) into ATR and XFD properly, but it could not convert the shorter

I also found some bugs in Imagic while developing ACVT. In this test:
ATR1 -> DCM -> ATR2, Imagic created few broken atrs (ATR1 != ATR2). I
can't give better details, as it was long time ago.

> - both Imagic and ACVT cannot convert any images that

Hello!

You are talking about vertical color bar-like effects? If yes, this can be done without P/M. There exists at least one demo (Studio dreams) that changes Antic-graphics modes within ONE scanline (in the opening screen Gr. 9 is mixed with Gr. 15). This demo works with Atari800win and can be found here:

http://www-user.tu-chemnitz.de/~sgl/atari/demos_index.html

Have some fun!

Andre

Source record: 30806

```
Look at the statement below :

10 A$ = "HERE"

If I run this program, is the word "HERE" stored in memory only at ADR(A$)
or does the word "HERE" also reside in the tokenized form of the basic
program memory?

The reason I ask, is to conserve on memory to allow for bigger basic
programs to be written, if I have a 1K string, I don't want to waste 1K on
the tokenized portion of memory. I can read the string data from a file
into the ADR(A$)

Anyone have any ideas on this?

I think it will appear in memory twice, first in the tokenized section of the basic program itself, and then again when you run it, since the string will be setup on the fly in ram. I think that is the case anyway, although I am not 100% sure, been ages since I messed with detokenizing basic files.

I saw in the book "the Atari Assembler" the following technique was used to reserve 10 bytes of memory for storing machine code :

10 DIM A$(1), E(10)

And then in his example he had a relocateable machine language routine 10 bytes long which he POKEd into ADR(A$)+1 to ADR(A$)+10

Now I know the byte making up A$ is wasted. That's ok, because he had to declare a string in order to know the ADRress of where his data was reserved for E. But even so he could have poked from ADR(E$)+0 to ADR(E$)+9 but he's making things simple to understand.

But my question is this, I tried setting E(1) = 300 and then did PRINT E(1) and it printed 300. So does the book DIM E(10) just for simplicity, since as I remembered and confirmed by setting and printing the value of E(1) as 300, each element of a numeric array actually occupies 2 bytes?

So he could have did :

10 DIM A$(1), E(5)

and still have reserved the ten bytes for his simple Machine Language routine from

ADR(A$)+1 to ADR(A$)+10 ???

Please let me know... I'm trying to get a feel for the way Atari Basic organizes memory with it's variables.

thanks

If I recall correctly Atari BASIC used 6 byte BCD (binary encoded decimal) so each numeric var used 6 bytes. It would make sense to assume each element of the numeric array also uses up 6 bytes.

1389. Programmers : I Need thy help!

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-06 04:21:08 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <oEgh8.7742$tg2.441082@e3500-atl1.usenetserver.com>
Source record: 30810

Ok, I've decided to go the route of using MAC/65 to assemble my relocatable machine language routines starting at location $0600.

My first question is, how much bytes do I have to play around with if compiling beginning at $0600, I just can't remember.

And the other more difficult question is, I use the ASM ,, #D:TEST.OBJ to save the compiled machine language code into the file TEST.OBJ

My question is, can anyone help me write a basic routine that will open this file TEST.OBJ and read the relocatable machine language subroutine (ending with RTS) into a DIMmed string? This is what I am looking for.

```
10 DIM TEST$(XXX) : MLSTART=ADR(TEST$) : MLFILE$ = "D:TEST.OBJ": GOSUB 31000

31000 REM READ THE OBJ DATA FROM MLFILE$ STARTING FROM ADDRESS MLSTART
32000 RETURN
```

I am not too familiar with the file format of a saved OBJ file using the ASM command above under MAC/65

Is it possible to know the length of the ML routine by just looking in the beginning of the file TEST.OBJ ??? That's not a big deal, since I am required to know the length before hand to DIM TEST$. Although it would be cool to DIM TEST$ dynamically after knowing the length of the ML routine... if that's possible!

By the way, this is the most memory efficient way I could think of
initializing relocateable ML routines to be called from Atari Basic, stored
in a string, not wasting memory of having a bunch of basic string assignment
statements or read/data statements to get the ML routine into memory.

A few thoughts:

Check the version of MAC/65 you've got. Some will assemble in blocks of either 128 or 256 bytes. This will segment your files, making it a pain to read them in.

As I recall, all object files have a six-byte header:

255, 255 = object code
Start address = where to load the file
Last 2 bytes = either end address or length; I forget which.

If you've got a multi-segment file, you'll have to load in each block of the file, one at a time, and append.

Hope this helps,

David P.

Lonny is absolutely correct! It will appear twice in memory. First in the tokenized Basic statement table for line 10 and second in the String/Array table contents at ADR(A$). That is why I read long data from disk files with CIO and use short routines directly as per:
900 X=USR(ADR("hhh*LVd"))

Alternatively you could use the dynamic screen editor Poke 842,13 to delete the definition lines after assigning the string contents.

Lonny is right on again. DIM E(10) reserves 66 bytes; there are 6 bytes per entry zero thru ten. I wondered, when I read that book example, what they were thinking. When I want some bytes for ML storage, I just DIM A$(10) and it save 10 bytes... at ADR(A$)

I think this is probably an error- maybe a typo on the dim statement.
If you have have 10 bytes of assembly, it would be better to dim
a$(10) and use adr(a$) thru adr(a$)+9 for it than overwriting a$ and
corrupting the first few floats in e. Are you sure e isn't being used
for something else?

Back when I was doing Assembly & Basic on the Atari, I found it quite
convienent to put assembly instructions as plain character literals in
assignments to strings; a$="......." where the . chars are replaced
with the ASCII chars with code = the instruction. It was very
consise, particularly for short routines, but caused a bit of trouble
when printing listings. Putting the asm in data statements, then
read-ing into a string or into page 6 was a bit more civilized.

256 bytes. 1 page = 256 bytes, 1 paragraph = 16 bytes, 1 word = 2 bytes (on the atari). 0x600 is "page 6" because its the 7th chunk of 256 bytes. page 0 is the first chunk. Page 0 addresses are highly prized because the 6502 is able to do indirect addressing with them. By loading the low&hi bytes of a 16 bit address into any adjacent pair of page 0 addresses, you can address any 16 bit address, adjusting the effective address by adjusting the page 0 registers. IIRC, the even page 0 address gets the low byte of the address and the odd one gets the higher. Unfortunately, the OS and Atari Basic explicitly leave only <one> pair of page 0 addresses for your use. My Apple 2 friends were aghast when I mentioned that, apparently the Apple leaves quite a few unused.

Page 6, starting at 0x600 hex or 1536 decimal, is only important because Basic & DOS always leave the entire 256 byte region alone. For this reason its frequently used for all kinds of stuff. DOS begins at page 7 if loaded, or Basic starts using it if not (unless you reserve memory w/ memlo).

If you need more than 256 bytes, there is an adjustment to "memlo", which reserves memory after dos and before basic. As I recall, the 850 R: driver loads itself after dos, shifting up memlo. On the 400&800 at least, theres a chunk of ram up in the cartridge b region, which you can use, but be careful with that because its easy to run into the display list.

On the 6502, your code is relocatable only if all your control flow occurs via branch instructions. jmp and jsr instructions are always absolute IIRC. If you want relocatable code, I think you'll end up having to disasemble your code at relocation-time (which isn't all that hard) to tweak the addresses (which can be a little subtle if you have data in the relocatable region).

Yes, refer to the 6 byte header- its documented lots of places, it gives the load address and # of bytes. If your code does use absolute addresses for code or internal data, the dim'ing approach won't work because you can't control the address that ends up starting off the reserved string memory. At that point, assembling your code for page 6 is pretty much your only easy alternative.

Speaking of page 6, how many bytes are available...

and if I'm using Mac/65 (ver 1.02) what should I indicate as the beginning address of the compiled code, if page 6 turns out not to be big enough...?

I'm going for relocatable code all the way. I realize I won't be able to do jsr or jmps. It will all be branch statements, and in some cases double branches as if I remember correctly they have a range of -128 to +127

Mac/65 has a SIZE statement which shows the beginning address in memory the program starts, the ending memory the program occupies, and the last address it shows is the last possible memory address the program can use. So I guess I'll indicate the beggining address of my routine to be somewhere in between the second and third addresses the SIZE command gives.

Message-ID: <rCih8.40289$0C1.3218530@newsread1.prod.itd.earthlink.net>
Source record: 30819

Couple of questions at cross purposes here... When in Basic, you have 256 bytes available and considered protected at $0600 to $06FF. In rare cases, the 1st 128 bytes are subject to use by the OS when performing a large INPUT due to an overrun of the buffer at $580-$5FF. This has never yet happened to me yet...

Now, if you are actually doing relocatable code, I recommend you ORG it at $4000 or $6000 as opposed to $600 (more later). You are only limited in Atari Basic by the free memory up to 32767 bytes per string and your prograsmming ability to manage the 127/128 byte maximum branch distance.

The procedure with TEST.OBJ is straight forward with some caveats. Theoretically Atari object files begin with a 2-byte FF FF header and a 4-byte Start and End load vector pair in low-high byte order followed by the requisite number of data or code bytes. SynAssembler, the Atari Assembler Editor and Atari Macro Assembler produce files of this construction. You can easily open the file for read, GET and discard the FF FF header, GET and do the math on the addresses and go accordingly.

Now the wrinkle; Mac/65 tends to produce compound files consisting of chunks of about 253 bytes per block and each consecutive block having its 4-byte load vectors as per:
1st= FF FF 00 06 FD 06 A9 01 ...
2nd= FE 06 FB 07 82 CB A0...
3rd= FC 07 F9 08 20 56 E4... etc.

There are utilities to convert this output to solid unified files or occasionally you may Binary Load the file into memory with the Dos '/N' option and Binary Save it back as a single block with an optional run address. This is why $4000 in lieu of low memory like $0600 where you are constrained by DOS and DUP.

When your file is suitable, short routines can use:
```
30 FOR L=1 TO27:GET #1,B:TEST$(L)=CHR$(B):NEXT L
40 CLOSE #1...
```

Longer code needs CIO as for this fixed 1536 byte block:
```
1350 OPEN #1,4,0,"D1:DTOPCOD.DAT":I=832+16:POKE I+2,7
:POKE I+4,ADR(M$)-256*(INT(ADR(M$)/256))

1360 POKE I+5,INT(ADR(M$)/256):POKE I+8,0:POKE I+9,6
:X=USR(ADR("hhh*LVd"),16):CLOSE #1:RETURN
```

The asterisk and lowercase 'd' are inverse characters. I have a separate routine from Analog #13 for reading the headers and Poking the IOCB for a file of unknown length.

The MAC cart or at least the DDT part of it uses the first 128 bytes of page
6. You really have to start your code at $680 or so to be safe.

Better to just set aside some memory for your code.

1401. Programming for emulators

Newsgroup: comp.sys.atari.8bit

Source record: 30823

I'm interested in re-learning more about the Atari 8bitters after a long absence. I own actual hardware (several, actually!), but I find that I'm totally spoilled with my nice Windows keyboard and editing software.

I'd love to do BASIC editing (for example) on UltraEdit-32 and be able to cut and paste to an emulator...or alternately take a ASCII file and create a disc image around it.

I realize that BASIC is tokenized, but I'm curious if anyone has any tricks or utilities to help them do this.

Thanks!

-Don Holmberg

IIRC gr 9 is GTIA messing with graphics 8 (I forget the ANTIC mode!).GTIA registers can be modified within a scanline, so you can have gr8 and gr9 on a scanline.

Maybe when GTIA is in the 'gr9' type mode it ignores the colour bits from ANTIC. So the data from a gr 15 and gr 8 screen looks the same?

Sorry if this makes no sense! I know what I mean :-)

```

This is a nice exsample of having the string only once in memory. The ML-routine is stored only one time in tokenized form, and exactly this routine will be executed. But this works only with relocalizable routines.

As I remember is this a technique to clear all numbers of field-variables:

```
10 DIM A$(1),E(10),F(200),G(78),B$(1)
20 FOR P=ADR(A$) TO ADR(B$)
30 POKE P,0
40 NEXT P
```

Thats correct. Its the same antic mode (0x0F), but only a different
interpretation of GTIA, so both combine naturally.

Since ANTIC F color data is the same as that for the text mapping modes
2 and 3 (Graphics 0, and a format not supported by BASIC), even
"graphics 0" can be combined with the various GTIA modes.

> Maybe when GTIA is in the 'gr9' type mode it ignores the colour bits from

In memory? For sure, it's just the interpretation on the GTIA side
that differs.

So long,
Thomas

The MAC/65 has a command that tells you the available memory region. IIRC,
it is something like "SIZE". You may also reserve memory regions yourself,
IIRC that's the "LOMEM" command. Typically - for pure binary programs -
you should place them in a memory region that is still available even if
a dos is in use. $1F00 and up would be fine for DOS 2.0S and 2.5.

For BASIC code, page 6 is fine, but I'd rather suggest something between
the basic end and the memory top. Consider for example $8000 and up.

So long,
Thomas

Yeah but this would only apply to small ML routines that can fit into a
single basic line of code, am I correct in assuming this?

I think $8000 is what I'll use in MAC/65... bear in mind it's going to be
relocateable code that will find it's home in a basic DIMed string anyways.

By the way, anyone know the size limitation of a basic DIMed string?

> 1360 POKE I+5,INT(ADR(M$)/256):POKE I+8,0:POKE I+9,6
> :X=USR(ADR("hhh*LVd"),16):CLOSE #1:RETURN

I+8 and I+9 contain the lo and hi bytes representing the length of the ML routine that I want to be read into M$?

Also, by using the command in MAC/65 ver 1.01 to assemble the object code into the file TEST.OBJ :

ASM , , #D:TEST.OBJ

What would be the best way to go about converting this file into another file that your basic routine above will work reading from it into M$?

Is there some way to do a binary load of TEST.OBJ you mentioned dos '/N' option and then doing binary save. What dos allows me to binary load TEST.OBJ as created by MAC/65 without running the obj after loading it? And what's the best way to save it back so your basic routine above can load it into M$ without further modification?

thanks for the info! I'm in heaven :)

1413. SIO2IDE interface for 8bit

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-06 15:36:36 UTC
From: Marek M <marekm@aritech.com.pl>
Message-ID: <a65cs9$6g1$1@news2.ipartners.pl>
Source record: 30834

If you are looking for HDD & CD-ROM interface for your 8bit Atari please
check SIO2IDE interface:

http://www.atari.cuprum.com.pl/ (SIO2IDE)

Currently there are three SIO2IDE branches:

- Branch 1.X, latest version 1.6 (this branch will not be developed):
- based on Atmel AVR AT90S8515 micro @ 4.9152MHz
- 8bit IDE ATA support (CHS mode)
- max 48 partitions * 16MB
- emulates Atari disks D1 to D15
- uses only half of disk space
- HDD can be easy configured from Atari (tool available on WWW)

- Branch 2.X, latest version 2.1:
- based on Atmel AVR ATmega161 micro @ 4.9152MHz
- 16bit IDE ATA support (CHS and LBA mode)
- FAT16 and FAT32 support
- ATR file support
- gives full access to subdirectories
- emulates Atari disks D1 to D7
- HDD can be easy configured from PC or Atari (tools available on WWW)

- Branch 3.X, latest version 3.0 (will be released next week):
- based on Atmel AVR ATmega161 micro @ 7.3728MHz
- 16bit IDE ATA support (CHS and LBA mode)
- FAT16 and FAT32 support
- 16bit IDE ATAPI support
- ISO9660 support for CD-ROM (now you can boot your Atari from CD and much
more ....)
- ATR file support
- gives full access to subdirectories
- emulates Atari disks D1 to D7
- HDD can be easy configured from PC or Atari

Note that English documents will be available soon.

Regards,
Marek

1414. Re: Programming for emulators

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-06 15:43:54 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <sEqh8.4222$Yd.153894@e3500-atl1.usenetserver.com>
Source record: 30835

BASIC is tokenized but you're not limited to saving or loading only the tokenized version of your basic program.

If you write a basic program in your emulator and istead of saying SAVE "D:TEST.BAS" you do LIST "D:TEST.LST" it saves it in similar to text format, however there might be some issue with line feeds missing after the carriage return. But I believe I've seen a utility to fix the .LST file into a windows standard .TXT file so you can do your editing on your PC application, save it as .TXT and then run the conversion program to make it a compatible .LST file that you can then load into memory with your emulator by using the command ENTER "D:TEST.LST"

By the way, when you do a SAVE and a LOAD you destroy any basic program that might have been in memory when you issue the LOAD command.

However when you do the ENTER "D:TEST.LST" command it preserves whatever basic program was in memory. If there is a conflict of line numbers, the line numbers in TEST.LST will overwrite those line numbers in basic.

Using LIST "D:TEST.LST" is advantageous as it allows you to store reusable code. For instance you might have a commonly used subroutine that you've coded beginning at 32000. You can just ENTER "D:MYSUB.LST" and it will merge with your existing program in memory. You can then do a GOSUB 32000 to use it. This is a sort of way of implemeting modular, resuable code in Atari Basic using LIST and ENTER instead of SAVE and the memory destructive LOAD command.

Hi folks,

I like to upgrade my 800XE to 128K as the 130XE.
Since they both have the same board layout, my question is:

Just installing only the missing RAM`s and Freddy-chip is suficient
in order to get it done?

Regards
Frank

Ron.
'ramaster.arc' is in the CTH archive (ftp.spudster.org).
utilities/BBS/Carina/flesec_u/dir_a
It is the one you're looking for I'm pretty sure. It only has the
.com and a .doc(partial). It was published in ROM magazine, about 1985.
There's an explanation of using RAM under the OS at
utilities/files/misc by John Picken. called RAM_ROM.ARC
I remember something about RAM under the OS on a Newell
disk I have, but can't access it right now. I think it just says how
to turn OS off and on.

(use PC to edit Atari BASIC).
You could do that. You'd lose the error checking Atari BASIC
does if you use it. Why not use an emulator and program BASIC
in that? You can use your PC editor, save an ASCII file, convert
it to ATASCII, then use imageman to put it on a MyDOS or DOS 2/2.5
image, then ENTER it in emulator or real Atari. I have an ASC2ATAS
utility on my site, under Assembler stuff www.en.com/users/russg.
Your PC editing would not be able to use Atari inverse or cntrl chars.
I dunno.

I don't know if you have your MAC manual, just in case remember that the defalt is not to generate memory resident code. This was done as a safety factor more then anything else so you wouldn't clobber yourself. You have to start with a like like:
10 .OPT OBJ

From your other post, Atari strings can be 32k in lenght. You will probably be ok starting your code at $8000 as that will probably give you at least 6k of code space. The cart itself uses from $A000-$BFFF and the screen uses maybe 1k under that if you don't change resolutions.

1420. Re: Question on Atari Basic Strings

Newsgroup: comp.sys.atari.8bit

Message-ID: <3c8658cc$0$1599$1dc6e903@news.corecomm.net>
Source record: 30842

```
X=USR(ADR("hhh*LVd))
Uhm I think that has to have the open channel # times 16, eg
X=USR(ADR("hhh*LVd),16)) for channel 1.
There's 256 bytes at page 6.
You can dynamic DIM up to about 1000 or 2000 less than avaialable
memory. Maybe 5000 is safer.
eg
x=fre(0)
x=x-2000
DIM A$(x)
An easy way to allocate memory for your use is this way.
You then don't care where BASIC puts it. If your ml code
is relocatable, then you can X=USR(ADR(A$)) and even
add parameters to your USR call. I'm sure I'm over simplifying/
left something out.
If you have an .obj contiguous/single stage file, you could open it
get FF FF then get next byte startadr lo next byte start adr hi
next byte end adr lo next byte end adr hi and then
for n=startadr to endadr
get #1,x
y=n-startadr
z=adr(a$):i=z+y
poke i,x
next n
It has been mentioned that numbers (eg 0,6,10) take up 6 bytes
in your BASIC code. You can save 4 bytes by making common
numbers variables eg. n0=0 n10=10.
probably messed up somewhere.
russg

You are right! From a processor usage point of view, it is not so convenient compared with a timer controlled interrupt routine. But it certainly works.

> of these after I reserve my 4 pages?

Ok, Peek(106)*256 (WITHOUT peek(105)) is where the system THINKS the
last available byte is, but it it actually the first UNavailable byte.
On powerup with the BASIC cart in, this will be $A0. Of course, this
also regards screen memory as usable memory.

Peek(742)*256+peek(741) IS the last usable byte of memory. In Graphics
mode 0 (normal text mode with the BASIC cart) this will be 39967. The
display list starts at 39968. Writing anything to locations 39968 to
39999 will at the very least scramble your screen, and possibly crash
the whole system. Writing from 40000 to 40960 will write directly to
the screen.

To reserve memory for your character set, you poke the new number into
106. From this page up to the beginning of BASIC will be regarded as
unavailable to BASIC, and free for whatever you need. Your screen
memory will also be set up below this limit as well, so as soon as you
poke 106 with what you need, you need to immediately after that do a
GRAPHICS 0 (or whatever mode you need) to reset the screen below this
threshold.

Hope this helps.

As long as it is relocatable, its makes little difference as it will not usually be executed from that address. The only considerations are a place to debug it and staying out of the system's work space. That normally leaves everything from about $3500-$9A00.

And every page is 256 bytes.

1431. Please help clairfy these memory locations!

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-06 22:50:01 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <Q_wh8.2417$Nn6.257022@e3500-atl2.usenetserver.com>
Source record: 30751

On the topic of redefining char sets from atari basic I read in one book, that address 742 was the MSB of the high end of user available memory.

In another book, I read that address 106 was the MSB of something called RAMTOP.

I tried looking at both from Atari Basic direct mode :

peek(106)*256+peek(105) = 41119

peek(742)*256+peek(741) = 39967

So can anyone clarify what is what and which is better to use to reserve 1k for my graphics 0 char set, and do I need to poke back new values to either of these after I reserve my 4 pages?

1432. Mydos Atari basic wedge

Source record: 30753

Yes, standard IOCB stuff; $340 (832) is #0 and add 16 for each block up to #7. I+2 is the command, I+4 and I+5 are the buffer (lo hi) address and I+8 and I+9 are the (lo hi) byte count to move. You can poke all the bytes from Basic, but CIO must be called from machine language with everything set. The USR( ) call passes the IOCB # times 16 so it can be in the X register for the execution of the CIO routine. I use a JMP to the vector rather than a JSR and immediate RTS. X=USR(ADR("hhh*LVd"),16)
h > PLA # parameters passed =1, discard
h > PLA hi byte of 16 = 0, discard
h > PLA lo byte of 16 = 16 or $10, iocb offset
* > TAX put it in X
LVd > JMP $E456 ciov, its rts sends you back to Basic

The simplest and most direct way to unify a compound file is to get it all together into RAM and do a binary SAVE. If you assemble into RAM, you can do the save without going to DOS. AsmEd uses SAVE#D:TEST.OBJ<4000,427F and Mac/65 uses BSAVE with the same syntax. If you assemble to disk, note the end address and then 'L' load it from DOS; Dos reads the vectors and places each block where it belongs so that it becomes contiguous and then 'K' saves it back to disk from appropriate address. TopDos is capable of showing you the address vectors of each block as it loads and 'Compute!'s 2nd Book of Atari' contained a handy utility called DSPLOAD.BAS which simply opens and reads an .OBJ file and displays each of the load vectors that comprise it.

Unless you have appended a run address to your file, it will just load and leave you at the 'Select Item...' prompt. Otherwise Dos 2.0/2.5 and MyDos both support the '/N' option added to the end of the load filename to suppress execution of run or initial vectors.

Thanks for the info, one more thing though do I issue the new graphics command immediately after poking 106, and then proceed to copy in the cset rom?

And what's a shadow register? I read that poking the chbase address 756 will also update 54281 and then the book said I could also poke 54281 from machine language. Is 54281 only pokeable from machine language? And what's the benefit of doing this rather than poking 756. What would happen if I poked 756 from machine language? Would 54281 not get updated as it would if I poked it from basic?

A little confused...

1437. My first ML routine for Atari Basic

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-07 01:44:16 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <ayzh8.2726$Nn6.307446@e3500-atl2.usenetserver.com>
Source record: 30758

Not my first, but my first revisited :)

I decided I'm going to dedicate the rest of my life to making Atari Basic extremely powerful and easy to implement graphics techniques without knowing much. Of course I'm going to do this by trying to produce relocateable ML routines that can be called by USR.

My first routine I was thinking would be to do an all in one ML routine that would take care of relocating the char set for the Atari Basic programmer and simply return to him the starting address of his modifyable char set.

The ML routine planned is as follows :

MYCSET = USR(ADR(MYCSET$))

MYCSET$ will contain the relocateable ML routine.

Now I'm going to assume the user has already entered into the graphics mode of choice before calling this routine. This is what I plan on doing in the routine :

PLA -- number of usr variables will be zero and have to clear
stack anyways
STA 212 -- zero the LSB of the returned value from the USR function,
will be zero because character set base will always start on a page
boundary. Pretty cool optimization huh? :)

copy the rom cset at 57344 into the address beginning at 256 * (PEEK(106)-4)

update the new CHBASE with poke 756, PEEK(106)-4 and STA 213 right after
for the MSB of the returned value of the usr function.

I am not going to update the value in 106, or should I? I haven't gotten to PM graphics just yet but if I need to reserve memory for it as well, then I should update the value in 106 in this ML routine so if I take the same action in my PM graphics ML routine using 106 would still be safe?... please give me your input.

thanks. I want Atari Basic to be freaking awesome when I'm done with all my ML routines.

It's for the 2600. The only ones I ever see anymore are for australian machines (PAL). You actually take the case apart and install the keyboard where the panel goes. Plug it into the cart slot and joystick ports and voila- a 4K computer!
They made them for US machines as well but they've become extremely rare.
Mo

The SIO2IDE interface is intended to function like other Atari peripherals
attached to the SIO connector.
Because of that:
- you don't need to replace your original Atari OS
- installing SIO2IDE is very simple you even don't need to open your Atari

Of course I am working on the HS mode for the SIO2IDE. I will try to add XF
or US Doubler HS mode.

Hi,

For an PBI device you also don't need to open your Atari. Just plug it in.
It's not that I don't like your upgrade, I do like it but there are no new
interfaces for the PBI bus, and for alot of users like myself I have several
interfaces.

2x Blackbox: This is a very good interface, with software in ROM and easy
to use even for beginners...
1x KMK IDE: Good interface, only software is difficult.
1x MSC IDE: The only interface that has been made with a CD-ROM driver..

I just wondered if the interface could be changed a little bit to use
parallel I/O because it's faster then SIO. Secondly I really like your
interface with CD-ROM and FAT support. It's very good. I also think the
SIO2IDE would not be much different then a SIO2IDE. Only the SIO interface
part will be replaced. A normal PBI device acts like a SIO device so maybe
you want to take a look it this too. With SIO I think the maximum
transferrate would be 5 or 6 Kb a second. With PBI you can get over
32Kb/sec...

Maybe some PBI experts can give some more info...

I just searched www.reichelt.de and found the ATmega 161 PDIP for
EUR 12,50. So I guess the total cost for all parts would be
approximately EUR 20-30.

That would be quite cheap, so I think it's a nice idea to
just try it!

so long,

Hias

it's done using a VBI and DLI procedure. I found this little programm
as a demonstration source code to "Bibo Assembler". Unfortunately, I
can't move it to work without Bibo-ASM, perhaps somebody can correct
my translation?

1451. Black-box with big harddisk...

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-07 14:52:27 UTC
From: TXG <txg@the-underground.myweb.nl>
Message-ID: <3c8780c5$0$90064$e4fe514c@dreader1.news.xs4all.nl>
Source record: 30772

Hi,

I just got an 2,1 Gb harddisk and want to connect it to my Black-box. It does work except in the controller menu I can't put a number higher then 15 in the HEADS selection. The harddisk I have has 18 heads. But the cylinders 2465 is not a problem. Is there a way to use the full harddisk or will I loose 27%???

TXG/MNX

1452. Re: SIO2IDE with English descriptions

Newsgroup: comp.sys.atari.8bit

Message-ID: <a67vci$1mah$1@news2.ipartners.pl>
Source record: 30773

```
Please note that not all 8bit Ataris have PBI.
I have 65XE and I can not use any PBI device.
SIO is common for all 8bit Ataris.

Marek M

Source record: 30775

Hmm I heard of some 65XE systems without PBI but all I have seen do have one, on the XE series it's the combination of the cartridge port together with the second ECI port.

There are pcb's you can use to make it just like the 600XL/800XL computers.

Your interface is nice, just the speed is something I really need on my 8-bit. I run my BBS from my Black-box but there is no CD-ROM support. Your interface supports it but will be slower then my Black-box...

One more think.

I think that only SIO2IDE supports FAT16/32 and ISO9660 filesystems at the moment.

I fancied an 800 as I lost mine way back so bid on one via ebay.

All power to the seller but I do wonder about the buyer (well just a
little).. :-)

You were not the winning bidder on the following closed item:

Item Title: ATARI 800 Computer - Twin 810 Disk Drives ++
Final Price: ï¿½102.99
Your Max Bid: ï¿½25.00

I know for sure I have several 65XE and 800XE systems with full PBI support overhere.
Some of those systems are upgraded to 130XE or more memory. They work great with the Black-box.

What's told in this documentation is only for US 65XE systems I guess...

I have 65XE without PBI for sure (see pictures, only cartridge slot) and this is the most popular 65XE version in Poland.

U?ytkownik "TXG" <txg@the-underground.myweb.nl> napisa? w wiadomo?ci news:3c878858$0$90041$e4fe514c@dreader1.news.xs4all.nl...

Who? Me, I have 1Mb in my 130XE and it still isn't enough my ramdisk is completly full... I run a BBS on that system...

Secondly when you have a big harddisk you can put many diskettes on it which is very easy. Up-to 96 partitions from 16Mb each...

For programming on 8-bit a big ramdisk is nice, you can put all your lib's and tools in it. But when I need to fill my ramdisk, I like to do it from a batch file and because there are no floppy's that can hold 1Mb (Exept the HDI) and I don't like to swap disks I use a harddisk.

My old harddisk began to make to much noise and I think it was a matter of days before it stops for ever, what would mean I lose all data.... now I put everything on my new harddisk, but I like to fill it completly...

I Understand that the UK and some western European countries recived mainly
65XEs with PBI, The rest of the world had em without PBI. I don't think i
have ever seen a PBI less version, but i live in the UK. In America and
other places the PBI less version is the norm.

800s, didn't have one IIRC
Not sure if the one on the XL range is compatable with the XE ones, so for
maximum compatability SIO is the way to go.

And if your ham fisted with a soldering iorn like i am, the less playing
with the guts of my machine the better ;o)

I can tell you that the XE/XL PBI is the same exept from the connector.
There are adapter pcb's which makes it just like the XL/XE series. You will
have 1 cartridge like the XL and the 50 pin connector. It's also very handy
such a pcb because the cartridge from the XE is not very handy when using
R-time8 + SDX

SIO is great ... just the speed is not nice when transfering big files from
a CD-ROM or other things....

Not all Atari's have the PBI, like the XEGM and the 1200XL

SIO is fully compatible with all...

I asked Bob Puff about this when I set up my BB. The limit is approx. 1 GB
of usable space on the hard drive due to the limits of BB config parameters.
Anyhow, the partition table is limited to 96, so at 16MB each, you still
would be limited to about 1.5GB. Of course you could do the BB flash rom
upgrade and start hacking the BB rom to get by these limitations...

> head and want to hear it on my PC.

You'd probably have better luck looking for it in sap format... SAP is
a format for storing Atari 8bit music from a variety of sources, this
page has more info:
http://asma.dspaudio.com/download.htm

...including an archive (1,387 files) and a plug-in for WinAMP to play
them. No sign of Agent USA, but they claim that ripping music from
existing games is easy... never tried it, so I can't comment.

However, it is painfully crippled IMHO because it plays all music at
50kHz, the same as playing on an emulator in PAL mode. This means that
the "classic" games which were written with NTSC in mind play
noticably slower than they should. I tried fiddling and was not able
to find a way to get them to play at 60. Maybe I should try e-mailing
the author one of these days...

Except for them playing slowly, it is otherwise very impressive - a
very nice reproduction of the "real sound", the SAP files can include
multiple songs (ie, all the different music from a single game in one
file), and they're tiny - usually between .5 and 4K.

Maybe your ISP is preventing you from sending to bellsouth.net ?? Has someone reported you as abuse to that domain?

I am receiving all kinds of junkmail, so everything looks ok from my end, I have no one in block senders list ...

1473. Re: Please help clairfy these memory locations!

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-07 18:30:03 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <LkOh8.964$Vx1.48313@newsread1.prod.itd.earthlink.net>
Source record: 30794

First DO NOT use location 105 as part of the calculation for the top of memory!

The following is what I understand:

RAMTOP (106) contains the page number (high byte, and there is no low byte here) of what the system believes is the total Ram capacity. The system will not use any memory *above* this value because it does not think any is there. One caveat: the 400/800 OS A and OS B contained a bug that could zero up to 800 bytes above RAMTOP during a clear screen or text window scroll - remember, the system does not think RAM is there. The XL/XE OS successfully corrected this problem.

MEMTOP (741-2) contains the address (low byte, high byte) of the highest free memory location for program and data use; it is available for Basic use because the display id not using it. The display list and screen ram begin here and go up. The system will not use any memory *below* this value for the display. Basic and the OS cooperate to avoid memory use conflicts; when a graphic mode change requires more RAM, it will adjust MEMTOP down as needed, but not if MEMTOP would be pushed below APPMHI (14-5). Basic generates an out of memory error when program or string space would exceed MEMTOP.

MEMLO (743-4) contains the address (low, high) of the lowest free memory for application use. Basic will not put program or data *below* this location *after* it passes the MEMLO value to LOMEM (128-9). MEMLO contents are passed to LOMEM with the 'NEW' command or initializing the cartridge; both are difficult under program control... The OS sets MEMLO at 1792 and DOS bumps it up to about 7500-9000 depending on version and buffer needs. Sparta is usually lower and the 850 interface handler pushes it higher. MEMLO is normally adjusted by an Autorun.Sys file during boot before Basic starts, to protect memory below your program.

Lowering RAMTOP by a POKE 106,PEEK(106)-4 followed by a GRAPHICS call will force the OS to move the display below your new value. There are no additional pokes needed to preserve that memory.

Hi Mike;

Where are you? Most of us would send you a DOS disk for the cost of a disk
and postage between $1 and $2, and would probably fill the remainder of that
disk. PC => A8 transfer with your hardware is going to be SIO2PC or RVerter
null modem cable. I think this page has info on both:

1475. Re: Mydos Atari basic wedge

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-07 18:52:03 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <nFOh8.1015$Vx1.51320@newsread1.prod.itd.earthlink.net>
Source record: 30796

Basic wedge refers to a method of inserting your own ML parse commands
routine into the screen editor process. You just look for your new commands
and pass anything else to Basic. The first I saw was published in Compute!
probably around '82-83. I have not seen any info on contents of the MyDos
cart.

Howdy *.*!

I found some old demonstration sources to bibo-assembler by compy shop. While Shawn Jefferson was asking for it I did understand the sources and rewrote it completly for better readability. It can be compiled with the wonderfull ATasm Atari Compiler and should be compatible to MAC/65. If you are interested in a text-file or binary-executable just e-mail me.

Have fun!

But you can only use up to 10x16MB at once. For more, you have to swap some
partitions...
What DOS do you use? SpartaDOS?

Mirko

Do you think ?102.99 is too much for the Atari 800 and the two
810 disk drives?

Hi Marek-
I am very enthusiastic about SIO2IDE and look forward to purchasing one! But I have been wondering about the HS. Even at 19200, won't the drive should respond much faster -- much like a "virtual" drive on APE or SIO2PC? Of course, 2X would certainly be better! :-) Congratulations for making this a reality!
Larry

Yep, I use SpartaDOS, but you can swap partitions with software. Without manually have to swap them. The other thing would be to rewrite SpartaDOS to use the 64Mb limit that the Black-box knows. There are already 2 extra bits reserved for this task only there still isn't a DOS that supports it....

Hey and it gets even better! I got my hands on Datasofts Basic compiler! As long as you write compiler-legal Atari basic code it will generate a dos binary loadable file. I tested it with a small print hello and everything works. Don't do any dynamic DIMming or goto's or gosub's with variables, that sort of thing.

So now, coupled with my ML routines and this wonderful Basic compiler that can run under Atari800Win at full speed, you're looking at one heck of a fun time programming games!!

Next thing on my list is to download my old game from :

http://www.atarimagazines.com/v7n7/DimentionWizards.html

And convert the ML basic string into data statements because the compiler doesn't like assigning substrings too well. The main code of this game is a relocateable ML routine that does almost everything. The basic just calls the ml routine over and over until some end conditions are met and then pronounces the winner and gets ready for a new game....

Yeah so I'm showing off my old Antic article!!!! DEAL WITH THE JEALOUSY!!!

;)

```
10 DIM B$(20):B$=CHR$(32):B$(20)=CHR$(32):B$(2)=B$
```

I saw this on line 3050 of my old game and I'm trying to make the code
datasoft basic compiler legal.

Is this some sort of short way of initializing a string to spaces?

I forgot what the hell I was doing...

Heck anywhere that is too much. (equals about $355NZ a good weeks wages for some people here), Most of the Atari 8bit computers sell here for $10 to $35NZ(modded with extra ram etc) each, and the disk drives about the same $10 to $35NZ (archiver/happy or something). Atari Printers sell for $Free to $5. ;-)

A NZ$1 = $0.41c US

And yes, I have brought at least 7 Atari's in the last two months, and close to 8 Disk Drives, so these are current prices. (Although I have no idea why I keep buying them! ;-)).

Heh, only if you give him $38 I bet!!! ;-)

Aaron

1491. Hey I found a ML move routine...written by ME!

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-08 05:07:40 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <XvXh8.19112$Yd.732415@e3500-atl1.usenetserver.com>
Source record: 30662

I was looking at my redefine charset routine at line 4000 of dimension
wizards, and I saw the following :

```
4011 MOV = ADR("blah blah blah")
4015 I = USR(MOV,57344,CH,1024)
```

So apparently I had written a relocateable ML routine for copying memory!

Time to dissassemble and learn from myself in the past!

Apparently I had also poked 106 with it's value - 8 . I guess I must have
reserved for PM graphics at the same time...

1492. Re: Lol..Madness

I think it was the 810's that jacked up the price. These seem to be going for a premium these days. The last 800 I bought was only $30.00 US and that was about a year ago. If it was the dual 810 I think it was the 815? It would go for a heck of alot more since these were really only prototypes that weren't mass-marketed.
Mo

Interesting...
As for getting the trick right on a screenshot - instead of an emulator, I'd use
the actual thing and hook the video output to the input of my TV tuner card on
the PC... Have done so with some stuff already.
The only thing I need is to insert in the middle of the screen an image in GR.9,
or maybe GR.11... Have you seen the typical test patterns when a TV station is
out of the air? The ones which include several different things combined?

I also downloaded the basic compiler disk images, a couple flavors of
them, so I know what you are talking about. Great fun and great way to
get your programs to machine language, but it is true you have to work
with the compiler to coax it to accept your code.

>So now, coupled with my ML routines and this wonderful Basic compiler that

That looks like a creative game. You weren't just authoring a
shoot-em-up clone. Pretty neat. The code may be too long once
compiled, but there is a chance you could put it on a cartridge.

>Yeah so I'm showing off my old Antic article!!!! DEAL WITH THE JEALOUSY!!!

> I saw this on line 3050 of my old game and I'm trying to make the code
> datasoft basic compiler legal.

> Is this some sort of short way of initializing a string to spaces?

Yes. You must set the last character (or the B$(2)=B$ will run away
and do bad things).

Let me use X instead of space.

You set

B$="X X"

when you set B$(2) to B$ it shifts it over:

B$(2)=B$ puts B$="XX .." to the the next
character, but it uses THIS (not the original)
to get the third character in the shift, so it puts
an X there as well.

To get patterns, I sometimes initialized the front of
the string with some characters, set the last
character and used things like B$(4)=B$

(where B$ is initialized to:
"ABCD X"
for example)

Paul

Complete madness! Who is buying these machines? Not long-time Atari enthusiasts surely.

It is still possible to find them at car boot sales and the like (though usually 800XLs/130XEs not 800s) for a pound or two.

Ebay is a *very* strange place. That said, I bid and occasionally win, and I followed that 800/twin drives auction but could see that the price was going way beyond common sense.

Ah well, good luck with the next one which appears (I might auction one of mine -- hope I make 102 quid!)

Cheers, Jerry

This statement fill B$ with 20 " (chr$(34)). (B$="""""""""""""""""""""). You
can do this slowlier this way:

10 DIM B$(20):FOR P=1 TO 20:B$(P)=CHR$(34):NEXT P

Mirko

You can't beat this technique for lenghthy strings, but for only 20
characters, the code for B$=" <20 spaces " is shorter. Of course,
for some characters, Mirko's solution is necessary.

--
-Ron

Experience is something you don't get until just after you need it.

I never understood UK money.
I've never done a pound char (£) ewe, I looked it up a CHR$(156).
I haven't looked up exchange rates lately. A pound UK used to
be about such that a US dollar was was worth 67% of a pound
and a German mark was worth 67% of a US dollar.
What's a quid?
Is there a £ key on European keyboards?
I heard UK money went decimal.
Maybe the new Euro currency will help clear things up.
I have two working 800s and can set up a third with just
the boards, no case or keyboard. I'm sure that someone
mentions the double 810 drive is what caused the high (about $150 US).

Well,
I have 2 LZW compressors for the Atari - they are slow, i.e. compressing files takes some minutes, so compressing complete disks (which diskcom does) would take quite a while. Whereas Diskcom is as fast as a good sector copier... -Andreas.

1509. Re: Atari 8-Bit Computers: Frequently Asked Questions

Well,
if I understand the polish docs for Atari Desktop, it is free (coded in
Assembler/ML language). The whole thing needs at least a DD (180k) disk,
but works on 64k machines. Just a few days ago I also found "Windows XL"
written in turbo Basic XL by Joerg Forg, also free. Maybe something to
improve your BOSS ?!? -Andreas.

Well,
the 800XE already has the Freddy chip. what you need is the Gate Array
chip (GAL), which can only be found on (broken/defective) 130XE machines
or at BEST electronics... -Andreas

Well,
your (eastern european) XE has an ECI port - doesn`t it ?!?
Thus, on XL use the PBI, on the XE use the cart+ECI ports (or an adapter
to convert cart+ECI into PBI; here in germany R.David made such an
adapter, but it is sold out long ago). I once had such an XE adapter and
used the msc ide interface with it, without any problems (maybe I used
the my-Ide also with it, not sure about that)... -andreas.

Well,
I have two (eastern european) 65 XE`s and both do have the ECI and thus
both can have a PBI - as said before, I used them with the msc ide
interface without problems... only NTSC versions of the 65XE lack the
ECI port... -andreas.

Well,
why not use ultra speed which is common for Happy, Speedy, USD and other
drives?!
Runs with approx. 78000 Baud (Happy and Speedy with Cache; USD and some
others with sector skewing). Just a thought. Afaik the SIO bus is
limited to 100,000 Baud (in Atari OS 19200 is set as the standard)
whereas the PBI can have a max. of approx. 500,000 baud (this is
user-definable somehow). Thus, SIO devices can reach a max. of approx.
12k per second, PBI devices can have a max. of approx. 50-60k per
second... Don`t nail me (hand and foot) if I am wrong.
-Andreas.

I found schematics for the 256K upgrade done by Wes Newell at
www.atariworld.com/newell.html. I am sure you can use it to build your
own.

Well the thing about the Euro is that just about every euro. country went Euro except the UK and France. The two most screwed up currencies if you ask me. I still don't know how to make the pound sign with my keyboard, I just use a # (which is the symbol for pound in weight I think).

The shadow registers are user friendly means for us to control system properties with a Poke. The OS takes them 60 times per second during VBI and transfers them to the actual hardware registers used by the chips.

This allows for creative displays; when our DLI routines STA new data to those hardware locations at assembly speed, the change will appear immediately in the middle of the screen. The OS then restores the shadow value during VBI so the main screen is unchanged when redrawn from the top. This removes the burden on the programmer of controlling the entire screen every single microsecond and we don't have to waste a DLI to restore what we changed.

You must alter 106 and make the new graphics mode call before you copy a character set into that space. If PMG are involved, it is simpler to do the above only once for both protected areas.

Yeah I lloked further into my code and saw I did just that, however when I reserved for PM graphics I just poked 106 - 8 and didn't issue graphics 0. Oh well, it worked fine.

:)

I think I'd like to redo DW and make it ultra clean so it could be redable and compilable.

I already have the shapes, sounds and animations... so it shouldn't be too difficult.
